THIS is a subject upon which there exist very great differences of opinion among engineers themselves. There are many who disparage technical training altogether, and who think that the sooner a boy can enter the shops and get to practical work the better; that he cannot, in fact, spare the time necessary to become a college graduate, and that it is not necessary for him to do so, because he will be able to pick up all the technical training that will be of any use to him during the period of his apprenticeship.

Present Day Facts.

Now, this is not my view, and I believe it to be a wholly mistaken one. Many engineers in the past have, without doubt, done good work, and made large fortunes, who have had very little scientific training, but every year as engineering works advance in magnitude and importance, and as competition grows keener, the opportunities for the untrained man to compete successfully with the highly trained engineer will become less and less. Competition is so severe that in large engineering works, such, for example, as a big span railway bridge, material must be cut down to the lowest limit compatible with safety, to secure an order, and if over-eagerness to get a contract leads an incompetent man to underestimate the material required, a disaster occurs, such as the failure of the Quebec Bridge over the St. Lawrence. Our engineers are now having to compete with very highly trained foreign engineers in all the different branches of the profession, and unless they are equally equipped, and I am afraid that at present they are not so as a rule, they will find it increasingly difficult to succeed. The idea that a lad entering the shops at the age of sixteen can learn all the things that should go to equip an up-to-date engineer by study in the evening is, I think, very unreasonable when you remember how trying the long hours are to a youth of that age.

Curriculum Suggested.

A very influential committee, presided over by Sir William White, sat last year to consider the best course to pursue in the training of an engineer. The question before them was not whether a college training or a workshop training was the best, there was no difference of opinion on that point, the need for both was fully recognized, the only question was whether the workshop or the college should come first, and they recommended that there should be one year spent in the works immediately after school, then the complete college course, followed by three years' practical training. This recommendation no doubt represents a compromise between the views of those who think the workshop should precede the college and those who think it should follow it. My own feeling is that is easier for a boy to do justice to a technical course when it follows directly on his school work. I know from personal experience how difficult I found the college work after an interval of three years spent in the shops, and I am very glad the committee have recommended that only one year should be interposed between the two courses. I have usually advised any who have consulted me on the subject of their sons' training, to enter them for a college course after leaving school at 16, and, if possible, to let them spend six weeks or so of the long vacation between the closing of schols at the end of July and the opening of the University Winter Session at the end of September, in some engineering works.

The distinction of an engineering degree is the privilege of only a few men, but it is within the reach of all of you who make the most of your opportunities here. It will be worth your while to keep in mind a maxim which a friend of mine, an earnest and successful schoolmaster, has inscribed on his school buildings:—"I shall not pass this way again."

I do not wish you to understand that this is going to be your only opportunity for educating yourselves. Indeed, from one point of view your engineering education can only be said to be well begun when you graduate from here; but it is here that you will be provided with the tools with which to carve out for yourselves your own fortunes. A workman poorly equipped with tools makes but a poor show in the world's workshops. Here and now is your opportunity to possess yourself of a complete outfit with which to engage in your handicraft, and this opportunity will never, in the same measure, be yours again.

Sir John I. Thornycroft.

Sir John Thornycroft commenced boat building at a very early age at Chiswick, being not much more than a lad when his father set him up in a small yard there. He built some very successful launches, faster than any of the small boats on the river at that time, but he soon made up his mind that he had not the technical knowledge necessary to enable him to carry out successfully the original work which he was ambitious to do. He, therefore, shut up his works and went off to Glasgow University to study under Professor Rankine. There he met a student who became his partner shortly afterwards, Mr. John Donaldson, who had also relinquished an appointment and sold all his property in order to go to the University. When Mr. Thornycroft returned to Chiswick after the completion of his college course, he felt competent to engage in the bold pioneering work with which his name will always be associated, and, it is not too much to say that no better equipped young naval architects and marine engineers were to be found in the country than John I. Thornycroft and John Donaldson when they commenced the building of torpedo boats in the seventies.

You must make up your mind what tools you want in order to fully equip yourself as an engineer. Now, what is an engineer? I will give you some definitions, which are all of them good.

Tredgold, nearly a century ago, defined engineering as "The art of directing the great sources of power in Nature for the use and convenience of

*Part I of abstract of an address delivered before the Hartley College Engineering Society.

man.'' This is a definition it is hard to improve upon, and it is incorporated in the charter of the Institution of Civil Engineers. Another definition states that ''Engineering treats of the intelligent direction of the laws governing matter, so as to produce effects which will reduce to a minimum the time and physical labor required to supply all the demands of the body of man, and leave more opportunity for the exercise of the mental and spiritual faculties.''

Still another writer defines it as ''A combination of science and art by which all strictly material productions that involve construction, either directly or indirectly, and which are serviceable to mankind, are evolved, designed and materialised.'' Someone who believes in short definitions has said, ''An engineer is a man who 'does' things.'' I suppose this writer would seek to differentiate him from the theologian who ''thinks'' things, and the author who ''writes'' things, the lawyer who ''says'' things, and the doctor who ''guesses'' things! But short definitions are always incomplete, and in my opinion to be a thoroughly good engineer you want to be able to ''think'' things, to ''write'' things, to ''say'' things, and to ''guess'' things, as well as to ''do'' things, and to do all these well. To be a good engineer you must know something of everything and everything of something.

The Tools.

We were speaking just now of tools. I am not going to dwell on the essential ones, such as mathematics, mechanics, physics, natural philosophy and chemistry; you know without my telling you that you must have these in your outfit, especially the first, but put down in your list of the tools that will be useful to you the acquirement of a good style of writing. You will be called upon to write reports upon some test, or experiment, or piece of field work. It is not only necessary to express yourself clearly and tersely, but it is useful to write a good legible hand and good legible figures, and not to forget the importance of correctness in spelling. Just when a man is trying to get his start in life, a little thing like a good style in handwriting, and ability to write a business-like letter, may just turn the scale in his favor when he is being weighed against a number of applicants personally unknown to those who have to make the selection.

Should you have occasion to make application by letter for a post as draughtman, assistant manager, surveyor, or the like, let your letter be a plain, simple statement of what you have done, and do not always seek to make out that you have been in charge of the particular piece of work upon which you have been engaged unless it is an incontrovertible fact. It may happen that the person to whom you are writing knows the man who really was in responsible charge, and your exaggerated pretensions will then make a bad impression.

Your First Position.

When you get your start in an engineer's office after graduation, try to show your employer that you are interested in your work, and do not work with one eye on the clock. Nothing gives a worse impression of a young man's capabilities than a want of keenness in his work. Again, a young college graduate will often find himself in receipt of pay a good deal below that of some of his colleagues whose scientfic attainments are much inferior to his own, yet whose ability to get out rapidly detail drawings for the shops makes them for the time being the more valuable men in the office. The technical school man is, in fact, handicapped on his first entrance into the drawing office by his want of practice in the routine work of an office, and he must not expect to earn so much for the first few years as the men who have spent the years at the drawing board which he has spent at college. He must do his best to make up for lost time in this respect, and have patience to wait for the opportunity which is sure to come in time, when his special training will bring him to the front.

Acquirement of Foreign Languages.

You will find that a thorough acquaintance with a foreign language is a very useful thing to have. If I may introduce for a moment a personal note, I will tell you of an experience of my own. When I was an apprentice I read a speech by Robert Lowe, then Chancellor of the Exchequer, in which he strongly advised young men to acquire thoroughly the French language by reading French literature and French newspapers. I made up my mind to try and do so, and I owe to this my first opportunity for promotion, as I had only been a few months in Messrs. Thornycroft's drawing office when someone was needed to go to Cherbourg to run the trials of some torpedo boats. The man whose business it was to do this was needed elsewhere, and my knowledge of French helped to secure my selection.

Press and Society Contributions.

A student or young associate member of engineering institutions may make a useful addition to his pocket-money by contributing to the proceedings abstracts from the technical press of foreign countries with the language of which he may be familiar. Besides keeping him abreast of what is being done in other countries, this is excellent practice in composition. There are many men with a thorough knowledge of their particular subject who are unable to write about it in good English, and are severely handicapped in consequence.

Do not seek to specialise too soon. You can never tell in which direction an opening may appear for you. Be just an engineer ready to turn your hand to anything within your scope, and my advice to you is not to expect to jump right into the berth for which you consider yourself to be the best suited as soon as you graduate. Take what offers so long as it is something into which you can throw a whole-hearted energy. It is always easier to get a better berth when you already have something than it is to find one when you need it badly. I am not advising you to be a rolling stone, because rolling stones generally roll downhill, but the great thing is to get going, jump on to the train somewhere, if it is only in the third-class, and trust to being able to get along to a more comfortable seat afterwards.

DURABILITY OF BALL BEARINGS.

A REMARKABLE record of the service of ball bearings was recently shown by an investigation made by a prominent consulting engineer. Two ball bearings made by a company in Philadeplhia were installed in one of the journal boxes of an electric car of the Atlantic City and Shore Railroad, which runs over all the street railway lines in that district, and after 3½ years' service, when the car had run about 150,000 miles, the journal box and its two bearings were removed for measurement. It was found that the mean or average radial freedom was 0.000046 in., or practically nothing, and the mean end play was 0.00125 in. The mean or average eccentricity of the inner race was found to be only 0.00004 in. also practically nothing. The mean radial freedom for the second ball bearing was found to be 0.0003 in., the mean or average end play 0.0097 in., and the mean or average eccentricity of the inner race 0.00025 in. The larger wear shown in the second bearing, small though it is, is accounted for by the fact that this particular bearing had to take the end thrust of the axle. It appears that during the 3½ years of service no attention was required, other than the supply of grease every 10 or 12 months. It is also understood that owing to the fact that the axles did not have the customary end play there has been a distinct reduction of flange wear, with the result that there is little or no shock on entering a curve, while the side sway is diminished.

INDUSTRIAL EDUCATION OF FOUNDRY APPRENTICE.*

By J. W. Horne, B.Sc. ...

IN the days when trade guilds were in existence (11th to the 16th century), the term "apprenticeship" signified not only practical training in a particular trade, but also training of character and intelligence, without which it is impossible to become a really efficient craftsman. In those days, during the period of apprenticeship a youth received such an education as trained him how to live, while at the same time fitting him to become an intelligent workman capable of earning sufficient to provide for the necessities of life. It is not the purpose of this paper to trace the changes which have taken place in the intervening centuries. Anyone who is interested in the subject will find considerable food for reflection in the contents of a book on the subject by Reginald A. Bray. He defines an apprenticeship system worthy of the name as having to satisfy three conditions:—

I.—"Adequate supervision for boys up to 18 years; which must take into account conduct and physical development.

II.—Must offer opportunities of training both general and special; that is, the training of the citizen, and the training of the workman.

III.—Provision of a suitable opening on completion of apprenticeship."

Purpose of Paper.

This system is ideal and if ever considered, is bound to lead to considerable controversy, but no one will deny that every effort should be put forward. No system of industrial education of the apprentice can be effective unless it gives him the capacity for becoming an intelligent workman, a healthy citizen and a good neighbor. The main purpose of this paper is to awaken an interest in the training of foundry apprentices, and to give in concentrated form an account of how the question is being tackled in some countries from which information can be obtained; to open up the whole question by discussion and to afford an opportunity of giving a definite lead to the council of this association as to what action should be taken in order that foundry apprentices may receive an industrial education fitting them to become not only intelligent molders but also healthy citizens.

*Abstract of paper read before the British Foundrymen's Association, August, 1912.

The problem of the more efficient education of the engineering mechanic has during late years had the serious consideration of many industrial firms, with the result that considerable progress has been made; but so far as information can be obtained, no great development has taken place in improving the educational standard attained by the foundry apprentice, although the problem has not been neglected by foundry employers.

Perhaps, the main reason why development in their case is, and has been, so slow, may be associated with the fact that as a trade, molding is generally held in low estimation. Though not the most mechanical of the trades, it must be remembered that a mold, to give a sound casting, requires more than the mere force necessary to ram the sand. There are a hundred and one things the molder must know and consider.

The Trade at Fault.

Molders may have themselves to blame for this condition of affairs; in the first place, because only an inconsiderable number of them have done, or are doing anything to increase the esteem in which the public hold the trade, by increasing their respect for themselves. In the second place, practically comparatively few molders put themselves about to study the underlying principles involved in the molders' art, or do anything to raise its status in the mechanical world. There can be no question that foundry work requires a considerable display of mechanical ability as well as a sound knowledge of the physical properties and composition of materials used, yet, although machinery is taking the place of mechanical skill of the individual in most industries, this cannot be said of the foundry, as no great advance has been made in dispensing with hand molding.

Great mechanical ability is required to make a man a reliable and good molder, and to prove this to the world should be the aim of every molder.

Molder Apprentice Intelligence.

One effect of the low estimation in which the trade is held by other tradesmen and engineers in general has always been evident in the poor supply of apprentices with a standard of intelligence equal to that of those entering other trades, especially engineering. While the age of the apprentice entering as a fitter or turner has been raised almost generally to 16, with a resulting advantage, the starting age for the foundry is 14. This means that the boy starts handicapped with a less developed intelligence and at an age when factory life will have a greater deteriorating effect. No doubt much can be done by inducing these foundry boys to attend evening continuation classes; but the good derived from them can only be limited, after a strenuous day in the shop. Perhaps, there is no department in an engineering works in which apprentices can be kept constantly employed.

The conclusions to be drawn from the above, with regard to lack of progress in intelligent and industrial education among foundry apprentices, is that it is due to the early age at which they leave school to enter an apprenticeship. Strenuous shop work and want of sufficiently developed intelligence at school prevents real progress at continuation classes. The first important duty, then, which would appear to devolve upon us, is to consider how best to raise the standard of the trade in the eyes of the public, so that the apprentices entering the foundry may be, as regards intelligence, equal to, if not better than those entering other trades.

Foundry Apprentice in Germany.

In Germany great attention has been and is being paid to the industrial education of the foundry apprentice. Generally, the scheme follows on the lines laid down at the beginning of the paper. In its industrial life it is recognized that one of the most important requisites for the flourishing of an enterprise is a capable staff of workmen, the training of whom is one of the most important tasks of a manufacturing establishment. Many of the large employers maintain apprentice schools within the factory, schools which are of an intellectual and not a manual character. Apprentices, therefore, obtain a training in manual dexterity and skill under strictly apprenticeship conditions, along with intellectual work closely related to the shop work.

The advantages of an employers' apprentice school are the saving of time going to and from school, and the releasing of employers from the duty of supervising apprentices outside of shop hours. For those apprentices whose employers are unable to run an apprentice school, facilities on the same lines are provided by the municipalities. Lud-

wig, Loewe & Co., of Berlin, were the pioneers in the formation of an apprentice school some 10 years ago. A short account of their scheme will be of considerable value and interest.

Molders' Practical Work.

Sand cores, nine months.
Loam cores, six months.
Sand molding, twelve months.
Carpentry, three months.
Large sand molding, seventeen months.

Loam molders' Practical Work.

Loam cores, six months.
Carpentry, two months.
Small loam molding, twelve months.
Large loam molding, twenty-seven months.
Testing and trimming, one month.

School Work.

Two afternoons a week—one from 2 to 6, and the other from 4 to 6, extending over the whole period of four years.

First Year.—General intelligence, two hours:—The legal relations of the employers and employes; the rights and duties of working men; the history of Trade Guilds; the relationship of apprentices to the Guilds; accident and sickness insurances; Patent and Trademark law; citizenship; reading and correspondence. Drawing, two hours ; instruction in which is specialised for foundrywork. Arithmetic, etc., two hours.

Second Year.—Workshop, two hours: —Construction of a foundry; general arrangement; descriptions of the cupola, machines, etc.; lighting and heating; safety appliances; rules for the prevention of accidents; hygiene; comradeship; courtesy; order and peace; payment of and claim for wages. Drawing, two hours. Model drawing specially related to foundry work. Arithmetic, two hours. Exercises in lighting and heating; transport of raw materials; costing.

Third Year. — Raw materials, two hours:—Materials of construction; their production, classes, and properties; forging, rolling, etc.; properties and manufacture of copper, tin, zinc, etc., and their alloys. Arithmetic and geometry, two hours, with special reference to the foundry, model drawing.

Fourth Year.—Foundry Education:—Description of the various foundry tools; molding; casting; cupola practice, etc. Citizenship, one hour:—Constitution of the State; State revenues and expenditures; the rights and duties of citizens, etc. Drawing, two hours, with special reference to foundry work.

This short excerpt from the syllabus indicates that, while a considerable part of the time is occupied with work directly connected with the practical side of the foundry, the most important side of the education is the development of the true idea of citizenship and general intelligence.

Industrial Education in United States.

The American Foundrymen's Association, a number of years ago, appointed a committee to handle the question of industrial education. The chairman of this committee is Mr. P. Kreuzpointner, with whom this movement is an earnest lifework. He reports that the National Government must come to the relief of the industries in the matter of industrial schools, since it is seen more and more that the industrial education of all the workers—and not only a few of the best ones—has become a necessity to preserve the industrial standing of the nation. The States of New York and Massachusetts have made a beginning—mention in the case of Cincinnati will be made later.

Definitions of Industrial Education.

To make any plan of industrial education effective, there must be earnest good-will and co-operation of educators, manufacturers, business men, and the workmen themselves through their trades' unions. This industrial education must be used not only as a means of imparting mechanical skill, but also to raise the ideals of citizenship and act as a socialising agency. As an introduction to this paper, industrial intelligence was defined. It will be advisable here to expand it to the ideals of Mr. Kreuzpointer, who says:—

"The sum and substance of industrial intelligence, which should be one of the most valuable achievements of a broad industrial education, gives a man the power to see beyond the immediate performance of the operation at which he is engaged for the time being; the power to see the relation of his skill and the results of his work to the success or failure of himself and his fellow workmen; the power to see the intimate connection and interdependence between his careful or careless, his intelligent or unintelligent, honest or dishonest action and his personal welfare, the welfare of those depending upon him and the welfare of the community at large. Industrial intelligence includes some knowledge of materials; ideas of their production and cost; ideas of the organization of a modern industry; ideas of the nature and extent of the business of the country, and a sense of duty and responsibility, as a mechanic as well as a citizen. An education is of little value when rated only by a purely commercial standard."

Again, to quote the words of Mr. Thomas Burt; "I doubt whether the people of England have a sufficiently high conception of what education really means. The general idea of getting on is to make a fortune. That is a poor conception. Would they be willing to be millionaires if their intellect had to be dwarfed and their souls blighted?"

The foregoing quotation from Mr. Kreuzpointner's report goes to show that Americans are going on the lines of Ludwig, Loewe & Co. In an address to the National Education Association Convention, San Francisco, in 1911, Mr. Kreutzpointner pointed out the aims and tendencies of industrial education in Europe, referring specially to Germany, as the result probably of a visit to Dr. G. Kerschensteiner, superintendent of the Schools of Munich, whose reorganised schools are justly attracting the attention of the industrial and educational world.

Progress Being Made.

Mention has been made regarding the system which has lately been put into operation at the University of Cincinnati for the production of foundrymen. The system is briefly as follows:—

(1)—Careful selection of high average quality of raw material by university and shop.

(2)—Students work at the university and shop on alternate weeks.

(3)—Students grouped in pairs; members alternate with each other in shop and university; both shop and class rooms are thus always manned.

(4)—Student does same class of work as a regular apprentice, and under same shop discipline. If expelled from the shop, he ceases to be a student of the university.

(5)—The student is paid for his work in the shops.

(6)—A shops' schedule is arranged between the University and shop authorities, and in accordance with this, a student is moved forward through the various departments of the shop.

(7)—Students' school work is identical in standard with that given in all high-grade engineering schools. The shop instruction and certain laboratory courses, which would be but a duplication, or rather a poor imitation of the experience the boys are getting in the shop, are omitted.

(8)—The course is five years in length.

In the opinion of Mr. Porter, who has charge of this work, the most interesting and valuable features of this course is the shop co-ordination work which has for its object the taking of the blinders off the boy, helping him to see the real meaning of the operations going on about him in the shops, and giving him an excellent benefit from shop experience. For example, if he has been on the cupola platform, the subject of pig-iron may be taken up, while at another time, the theory of the cupola may be explained, and so on. An effort is also made to introduce the student to the best literature of the foundry.

DRY-SAND MOLDING LARGE "T" CASTING.

By J. H. Eastham.

TWELVE turbine castings of "T" type, technically termed "nozzle bodies," were recently ordered at short notice. To save shop room by using a smaller cope, and to accommodate the horned branch indicated in Fig. 3, the two similar sides being bolted together. Seventeen bars were then cast from a template, altered to suit the pattern from the small end onwards and bolted to place over the pattern and joint with little or no trouble. The cope was next rammed up, hoisted off, finished, blackwashed, and placed on the stove car for one night's drying, whilst the drag part was finished and dried; three charcoal

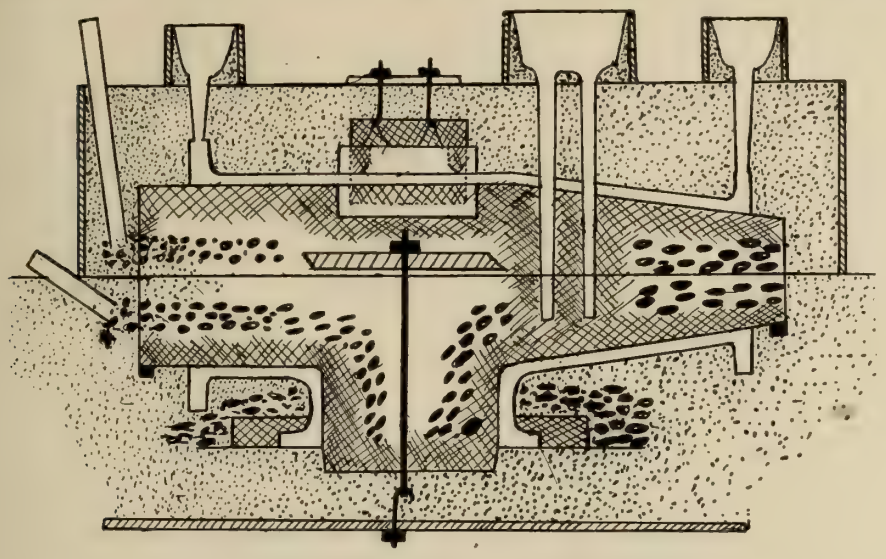

FIG. 3—SECTIONAL VIEW OF CLOSED MOULD.

piece, weighing 8,000 lbs., was moulded with the main branch downward. A pit was opened at the correct depth, and a bed levelled, on which the branch coreprint was laid, rammed up, and strickled off; the core forming the flange (shown at Fig. 2), being next set to position. The lower half of the pattern was placed with the large branch through the aperture in the flange core, a pair of semi-circular gratings being laid over the core to prevent risk of breakage whilst ramming under the body, after which, the job was rammed up to the joint in the usual way.

The upper half of the pattern was now placed over the lower, and the cope built up round it, two flanged ends and fires being lowered into the mould for the purpose. The core arbor arrangement, designed to last until completion of the order, was strong boxed-out type, the main branch piece being wedged to the body by a square socket device. The cost of rigging was, thereby, considerably reduced.

Fig. 3 is a sectional view of the closed mould, showing runners and risers, with method of bolting down the main core to the permanent grating in the foundry floor, also the branch core secured to the cope; whilst Fig. 4 (end view), explains the binders employed to secure the mould when ready for pouring.

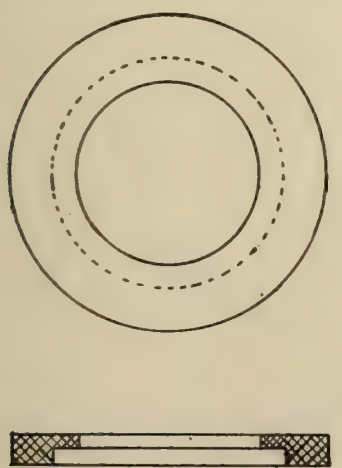

FIG. 2—FLANGE CORE.

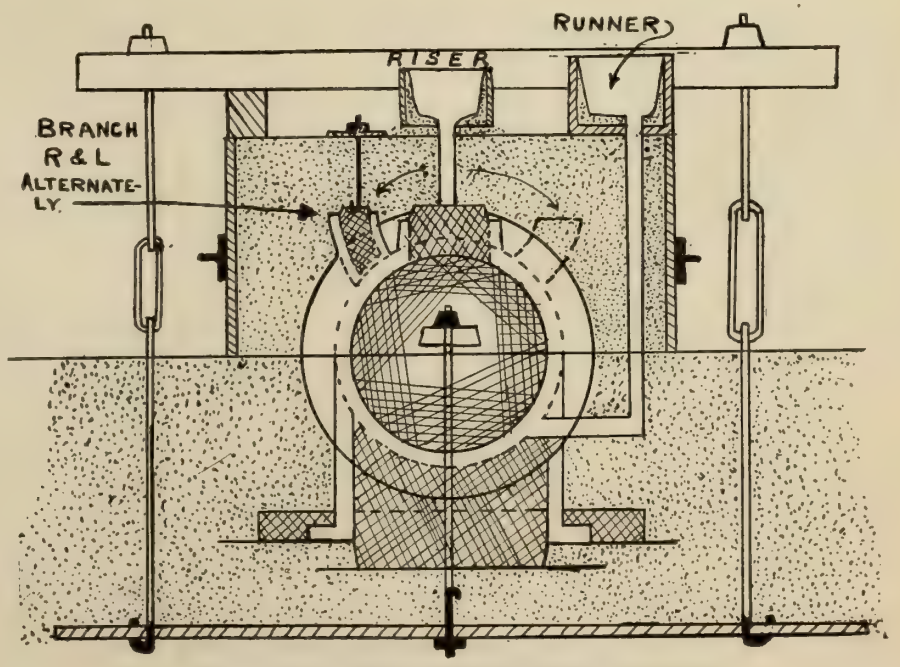

FIG. 4—END VIEW, SHOWING MOULD BINDERS.

ORNAMENTAL ENAMELLING.

ORNAMENTAL enamelling has been practised in the East from a very early period. Among historical nations, perhaps precedence in the art might justly be assigned to the Egyptians, the fathers of so many arts and sciences. The famous blue enamel, or, more properly, glaze, of which many fine examples remain, seems to have been produced with a copper oxide, and the process was employed at least as early as 1600 B.C., if not earlier. Enamel—from "esmail"—has for a basis a fusible and colorless glass, which is rendered opaque and colored by the use of metallic oxides. These substances, having been fused and cooled, are thoroughly powdered and washed before being applied to the surface to be enamelled. The whole is then fired.

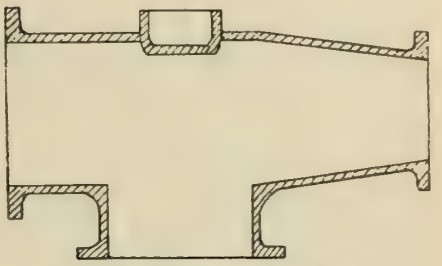

FIG. 1—TEE PIECE SECTION.

SIDELIGHTS ON INDUSTRIAL EFFICIENCY*

By H. L. Gantt.

THE word "Efficiency" is being used somewhat to excess. A great many people write and talk of efficiency who do not seem to have a clear conception of what the word means. It is the special business of the engineer to study efficiency, but the fact that a man styles himself an "efficiency engineer" is not necessarily a recommendation. Recently, a man prominent in the industrial field stated that it seemed as if everyone who had failed at everything else was advertising himself as an efficiency engineer.

Now, it is possible to be entirely in sympathy with bona-fide efforts to increase efficiency without being in sympathy with all this talk about it. A society has recently been formed for the promotion of national efficiency, and has spent some time trying to find a definition of the word. What we want is not necessarily a change in methods of work, but to do our work thoroughly. The author's work has sometimes been criticized because it is said to have been done too thoroughly—he goes too much into detail , etc. However, any work which has anything to do with engineering must be done thoroughly.

Fundamental Ideas.

With regard to industrial efficiency, it does not seem to be necessary to present a great many ideas; but it is necessary that the fundamental ideas and causes be clear. Some time ago, the financiers of the United States thought that they had solved the industrial problem through the great economies made possible by consolidation into huge combinations. Large trusts were formed, and it was believed that by eliminating competition it would be possible to manufacture and sell a great deal cheaper than had been possible in the past. These expectations, however, do not seem to have materialized, because the continually increasing cost of living seems to indicate that we need something more than able financing to round-out our theory of industrial economy. This has been a growing conviction on the part of students of our economic conditions for several years, but the most critical were not prepared for the admission, before the Interstate Commerce Commission, in November, 1910, by some of the most noted railroad financiers of the country, apparently seconded by Mr. Morgan himself, that they had done everything possible to reduce the expense of operating railroads, and that from now on, the public must accustom itself to increasing freight rates. These financiers thus admitted that, in the branch of industry in which the financial man is perhaps more nearly supreme than in any other, and in which competition has been practically eliminated, rising costs forced them to ask the public to bear a portion of their burden.

Production Cost Feature.

The student of economics asks if there is not something lacking in our system of industrial economy that make such requests necessary or even possible. If it is a fact that in any branch of industry every possible economy has been effected, and that in the future, costs will be higher, we are confronted with a very serious condition, the far-reaching effect of which it is hard to foresee. It has been our boast in the past that with our labor-saving machinery and our improved methods, we had so reduced costs as to make the luxuries of to-day the necessities of to-morrow. If in any branch of industry, we are forced to acknowledge that costs will in the future be higher, are we not pointing to the time when these necessities will again be luxuries?

The Financier View Inconclusive.

The statement, which happily few believe to be a fact, that in any industry the minimum cost has been reached, and that hereafter costs must be higher, is such a serious one, and fraught with such serious consequences to our industries at large, that many of us feel like asking the great financiers who are backing this statement to speak for themselves only, for there are many engineers who not only do not agree with them, but who believe there are means of increasing efficiencies and reducing costs, of which the financier has as yet no conception. These methods have been applied in isolated cases, and to a greater or less degree to a great variety of industries. They have produced a better and a cheaper product; and the workers are better paid and better satisfied.

In making this statement it is not intended to disparge the work of the financier, but to remind him that the civilization of to-day has not been built up solely by his efforts. In this process, the engineer and his able assistant, the skilled mechanic, have been even more integral factors than the financier, and until they hold up their hands and say the end is reached, that modern combination of engineer and mechanic, the mechanical engineer, respectfully asks that they withhold their cry of despair, and allow him to present what Mr. Brandeis calls his "Gospel of Hope."

Modern Conditions.

Until a few years ago, all mechanical knowledge was empirical. It had been gathered by cut-and-dry methods through centuries, and was handed down with no written record. Yet it is wonderful what great progress has been made. The master workman of a century ago was justly proud of his work and of the apprentices that went forth from his shop. With the perfection of the steam engine, which is the foundation on which our civilization is built, and which was the invention of a mechanic whose work has had a greater influence on the world than that of all the financiers that ever lived —with the perfection of the steam engine, the master workman obtained cheap power, and was enabled to increase the size of his shop. The increase in size of the workman's shop gradually developed the factory system of to-day, in which the foreman and workmen have no interest other than their daily wage, and where they are too often laid off without cause and without notice, to suit the plans of the owner. Is it surprising, that, under these conditions, their interest in the training of apprentices should lag, and that the foreman and workmen should take but little trouble to train men who will shortly become their competitors?

Responsibility for Efficiency.

This, however, is not all. The owner too often puts all responsibility for the promotion of efficiency upon his superintendent and foremen, yet limits them in the wages they are allowed to pay, or the records they are allowed to keep. The records, as a rule, are sufficient for criticism, but not enough detailed to enable the foreman or superintendent to know where the inefficiencies are, or which of his men are most valuable to him.

In one concern, a man who had complete charge of all the cost records frankly avowed that he was not keeping these for the benefit of the superintendent. He was simply keeping them so that he would know what was being done; in other words, he was there to criticize, not to help.

He had a lot of clerks to help him do the work, and although he did not say so, this is what was in his mind:—Those records were to keep somebody from stealing something. In fact, there are too many records to keep somebody from stealing something, and not enough to help the man who has to do the work to do it right.

Friction of Conflicting Interests.

Railroad presidents claim that the increase of wages necessitates increased freight rates, which, if granted, must necessarily, in a meaure at least, increase the cost of living. Thus, neither arbitration nor collective bargaining, on which we have placed so much confidence in the past, gives promise of any permanent solution of our difficulties, and the time seems rapidly approaching when the friction of conflicting interests will seriously hamper our further development. We, therefore, naturally, ask why these interests conflict. The answer is plain. Neither party has been willing to

*Abstract of an address before the American Society of Swedish Engineers, Brooklyn, N.Y.

consider the interest of the other. The employer has too ofen insisted on paying the lowest wage, regardless of the service rendered; while the employee, through his union, has demanded the highest wage regardless of what he gave in return.

Unequal Allocation of Profits.

I heard something, recently, that quite astonished me. I have heard the same thing from three or four persons; but the last time I heard it from a rather unexpected source. I have heard a number of men make the statement recently that the financier—the capitalist—was getting too large a percentage of the earnings of the increase in wealth. A man told me that a millionaire friend of his in Wall Street had made that statement to him. There is no question that within the last fifteen years a much greater percentage of the increased wealth has been harvested by those who already had wealth. The worker, the engineer, the producer, did not get the same proportion of it that he had gotten previously, and this is one of our troubles to-day.

Labor Unrest.

The very serious unrest in the labor world to-day is due to the fact that the workmen have made up their minds that they are going to get a larger percentage. Now, we have got to face that condition, by finding out what is the proper thing to do, and trying to do it as soon as we can. Such action will prevent what seems to be impending conflict, due to the fact that both employer and employee have disregarded the great principle of equity, which is the foundation of all harmony. In the commercial world it has long been recognized that transactions which do most to promote prosperity are those which are beneficial alike to buyer and seller. Does not the same law hold good in the industrial world in the purchase of labor? With the operation of such a law, the interests of the employer and employee become identical, and we have laid the foundation for their harmonious cooperation.

Efficiency Impossible Without Equity.

Having done this, we are ready for the next step—namely, the promotion of efficiency in the utilization of human effort. The progress so far made in this direction has in many cases been in spite of a lack of equity in the relations between the employers and employees. Consider how much faster progress could be made if all men were assured of an equitable return for their efforts. As a matter of fact, real efficiency is impossible without equity, for no man will continue to put forth his best efforts without a proper reward. The idea of doing work efficiently is comparatively new to people in general. It is only within very modern times that the best educated people have given any thought at all to the subject of physical work. The only serious subject requiring manual skill that was considered worthy of their attention previously, being that of fighting, or war. It was Sir Henry Bessemer's search for a stronger metal with which to make field guns that gave us Bessemer steel. Until within a few generations, it has been very much more important to defend the wealth you had than to acquire more than sufficed for your daily needs. Hence the importance of defense.

Ambition an Incentive to Efficiency.

The time has come, however, when a man no longer has to defend his property with his skill or life, and can devote his energies to acquiring a surplus for himself and family. The great majority of men are ambitious to secure such a surplus, and are willing to work efficiently and industrially if they can be assured of an equitable compensation. The precise method of compensation is comparatively immaterial, provided efficiency is rewarded and not penalized, as is too often the case.

READER, WHAT DO YOU KNOW?

Among readers of Canadian Machinery there is a clearly defined sincerity of desire to know how each overcomes the daily tasks of the machine, pattern and blacksmith shops, the foundry and boiler shops. It is believed that your methods and devices, while good, may be improved, and thereby made more valuable if you publish them, so that other brains may work on them. We will provide the setting and pay you for the material. When your fellow tradesman puts the superstructure on your foundation, we pay him and pass the "kink" on to you, free. Get into the game.

The Task Idea.

In trying to find a means for uniting the interests of the employer and employee, the task idea was developed — that is, the idea of putting before each workman a certain task to be performed in a given time, assuring him his regular wages if he could not perform the given task, and promising him a suitable reward in case he was able to perform the given task in the given time.

One of the important points relative to this method, frequently called "scientific management," is that the reward or bonus must be great enough so that the workman will feel that he is fully compensated for the extra exertion required to do the task. The bonus is usually from 20 to 50 per cent. of the regular day rate. Task work does not necessarily mean more severe work, but it means more continuous work under more favorable conditions.

Locating Losses.

Another important point that should always be noted is, that having set a task, the responsibility for its performance, does not rest upon the workman alone. Every case of lost bonus must be investigated by the management, and the reason determined. It seems very difficult to get people to grasp that idea and to go to that trouble. If a man does not make the bonus, they seem perfectly willing and content to let him lose it, and pay little attention to him. This is a great mistake, and tends to discredit the system, while the man is discouraged. It may not have been his fault; the machinery may have been out of order, the appliances he has been working with may have been unsuitable, or the material may have been inferior in quality. All these reasons may have prevented him from performing his task.

Frequently imperfections and defects in material bought have been found, simply, by investigating why the workman has been unable to perform his task, yet that material may have passed inspection. If, again, when some workman is unable to accomplish his task, a capable man in whom he has confidence tries to find out what the reason is, he will feel satisfied, and try to earn his bonus the next day. Therefore, in the task system, next to the subject of the proper task comes the necessity of investigating every case of lost bonus and of determining the reason.

When a proper scheme of management is devised by which all the available knowledge is used to plan the work, and if the tasks are set in accordance, and the workman liberally compensated for the performance of the task, there is no question but that marked economy can be produced by this new method of management.

—⚙—

Mr. L. J. Street, vice-president of the Canadian Inspection and Testing Laboratories, and district manager in Toronto for the past eight years, is severing his connection with that firm to go with the Dominion Iron and Steel Co., Sydney, C.B., as assistant to Mr. J. P. McNaughton, general sales manager.

• • •

Leslie R. Thomson, B.A., Sc., lecturer in civil engineering at the Univerisity of Manitoba, has resigned to accept a position with the Dominion Bridge Co., at Montreal.

PARS FROM CURRENT LITERATURE

Castor Oil.—A few years ago castor oil was the universal lubricant in India for both internal and external lubrication, but as engineers became more enlightened on the subject generally, castor oil for internal lubrication was discarded. The principle reason why castor oil has been condemned for internal lubrication is the breaking up of the oil into several corroding acids when exposed to high temperatures. As a lubricant for external bearings, however, castor oil is still largely used, and the old school of mechanical engineers will not listen to anything against it. A temperature test, however, will very soon show that, owing to the high fluid friction of castor oil, the running temperature of a bearing lubricated with a hydro-carbon oil will be considerably lower than that with castor oil.

* * *

Welded Lap Joints.—In some tests carried out in Germany on welded lap joints in boiler plates, two hand-welded joints were made, one being carefully worked at the right heat and the other being overheated. Tests were then carried out on numerous specimens cut from the plates, so as to include the joints, and either side. Half the test pieces were annealed before testing, their elastic limit and ultimate strength being lowered thereby. This indicates that the unannealed plates were considerably hardened by over-straining during welding, and annealing relieves the internal stresses. The detrimental effects of burning were very slight. On an average, the strength of a test piece containing the joint was 0.99 of that of the plain plate annealed, and 0.98 unannealed. The proportion for the elastic limit was between 0.85 and 0.98. It was concluded that the ratio of strength of joint to that of plate may safely be assumed to be 0.8, instead of 0.7 as specified in the German regulations.

* * *

Dust Explosions.—The amount of coal dust necessary to transmit a dust explosion is about one gramme per cubic metre of air. Such a quantity is frequently found, especially where high speed haulage is used. The most direct way of obtaining safety is by preventing its formation, and this can be done at the start by the use, for example, of hydraulic power to bring down the coal wet, and by enclosing tubs as thoroughly as possible. It can be removed to some extent by brushing, or, much better, by a fan collector. It can also be kept down by sprinkling with water, or, a more recent suggestion, by the use of a binder, such as soap or caustic soda with water. In a mine with the coal dust either removed or fixed, the danger of a local ignition of gas spreading through the workings would be entirely removed. This would not, of course, lower the standard of electrical plant, for all the conditions which apply to safety against ignition extend to prevention of shock.

* * *

Cleaning Boiler Flues.—The question of cleaning boiler flues mechanically appears to be receiving attention in various quarters. Two installations of vacuum plant have been tried for cleaning the flues of Lancashire boilers. In these, the men go inside the flues and manipulate a nozzle attached to a flexible pipe. Again in some cases it might be possible to work the pipe from the outside by providing special doors in the brickwork of the flues. Experiments are being made by one firm in this direction, and doubtless if any demand is created for such plants they will be greatly improved.

* * *

Starting Up Economisers.—It has recently been pointed out that accidents occasionally occur during the operation of starting up an economiser early in the morning. A careless attendant, for instance, on starting will sometimes open to the full, the dampers in the economiser chamber, and so allow the whole of the hot flue gas to pass through the chamber, forgetting for the moment that the engines or turbines and the feed pumps have not yet been started up and that there is consequently no water flowing through the economiser. Under these circumstances, the enclosed water becomes heated, until eventually evaporation into steam commences. The level of the water in the vertical pipes then becomes gradually lowered, with the result that the upper portion of the pipes, being bared of water, suffer from more or less overheating. Further, the steam so formed, by coming into contact with the water on the boiler side of the outlet valve, when the latter is opened, tends to cause "water hammer" action. This "water hammer" action causes crackling in the pipes, and it has in some instances led to fracture and explosion and serious injury to the engineer-in-charge.

* * *

Economiser Explosions.—The idea that an economiser is safe from explosion because it is only exposed to water pressure is probably due to the fact that vessels which have to be worked under steam or air pressure are invariably tested by means of water. The reason for so doing is that danger is eliminated of the parts flying violently asunder should any part fail,as would happen if steam or air were employed. There is, however, a great difference between an economiser under pressure and a steam boiler or other vessel under cold water pressure. In the latter case, in the event of any part of the structure failing, the pressure is instantly relieved, with very little increase in the volume of the fluid, and no great harm is done; in the former case much of the water in the economiser is usually at a temperature much greater than 212 deg. Fah., so that should the pressure be suddenly relieved due to failure of the containing vessel, a portion of the water would immediately flash into steam, the accompanying violent expansive force of which may cause entire disruption of the economiser.

* * *

Steam Pipe Expansion.—While the necessity of providing for expansion in long ranges of steam pipes is generally recognized, steam users sometimes overlook the importance, where such an expansion arrangement consists of a stuffing-box device and the ends of the length of piping are not anchored fast, of providing guard bolts to prevent the two parts being drawn asunder. The danger arising from the absence of such a provision is drawn attention to in Vulcan, and a failure is mentioned which occurred at a tinplate works a few months ago. There was a short length of pipe between the engine stop valve and the steam main leading to the boilers. The steam main and the short length were each fitted with a stuffing-box arrangement, but while that in the main was furnished with guard bolts, the short branch piece was not so provided, and when the pipes were put into operation, the two parts of the short length were drawn asunder, allowing steam to escape and scalding a laborer who was assisting on the job.

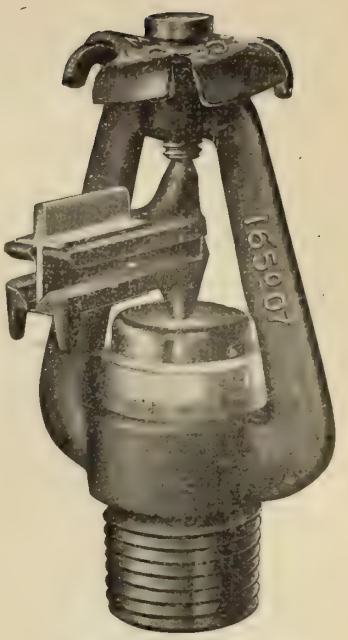
* * *

Heat Value Specifications. — In consequence of the increasing use of heat-value specifications in buying and selling coal in the United States, a demand has arisen for similar specifications to govern the purchase of fuel oils, and the Bureau of Mines has issued a pamphlet on the subject. "These specifications, to be satisfactory," says the author, "should establish not only the heating value of the oil, and thus show, like the specifications for coal, the number of heat units the purchaser obtains for a given price per unit quantity of fuel, but also the physical character of the oil, its flash-point and burning-point, and the quantity of extraneous matter it contains." The specific gravity of fuel oil, it is stated, should range from 0.85 to 0.96 at 15 deg. Cent., and the oil should be rejected if its specific gravity is above 0.97 at that temperature. It should be mobile, free from solid or semi-solid bodies, and should flow readily at ordinary atmospheric temperatures and under a head of 1 ft. of oil, through a 4-in. pipe 10 ft. in length. It should not congeal nor become too sluggish to flow at 0 deg. Cent., and should have a calorific value of not less than 10,000 calories per gramme (18,000 B.Th.U. per pound); 10,150 calories to be the standard.

The Fastest Fire Fighters in the World!

Faster than the quickest of Crack Metropolitan Fire Brigades – Deadly sure in their work—are

Manufacturer's Automatic Fire Sprinklers



HEAD (FULL SIZE CLOSED)

Always on guard—in the roar of the day, and in the silent hours of the night. Respond instantly to the call of fire itself. Absolutely independent in their action, and will fight till the fire is out. Insensible to fumes or smoke.

Manufacturer's Automatic Sprinklers installed in your factory or warehouse will pay for themselves in the insurance **premiums they will save.** And in addition to that, **they will give you protection that no ordinary fire insurance can give you—protection of your business from disastrous delay, protection of your employes, protection of your profits.**

Let us give you instances where Manufacturer's Automatic Sprinklers have been tried in the exacting test of fire itself. Let us tell you of firms who have installed them, and what they think of them.

Better still, let us give you, free, an estimate of what it will cost to protect your plant—the one you are building, or your old one. Full particulars will be given promptly.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

FOUNDRY AND MACHINE SHOP.

Weston, Ont.—A new steel foundry is about to start here according to report received. No particulars are given out as yet.

Brantford, Ont.—The Keeton Motors, Limited, incorporated for $200,000, and backed by members of the Verity Plow Company, are about to commence operations here. The plant has 30,000 square feet of floor space and will have a capacity of 350 cars per year.

Port Arthur, Ont.—Alex. Fergusson, of Halifax, N.S., recently announced his intention of considering the location of a foundry for the making and repairing of boilers. Mr. Fergusson is well known in the East, having there conducted one of the oldest establishments of this kind.

Edmonton, Alta.—By the end of September the $25,000 machine shop and foundry which is being erected at Industrial Heights by the Western Foundry and Machine Company will be complete and ready for operation, and the building of stationary, gasoline and steam rotary engines will commence in Edmonton. Work on the construction of the plant is already well advanced, and by September 15, the contractors promise the building will be ready for occupancy.

Welland, Ont.—R. W. Knight, of the McClintic-Marshall Construction Company, of Pittsburg, and E. O. C. Kuhule, of the plant at Carnegie, have organized a new company to build a steel fabricating foundry here. Work will start at once, and by November it is expected to have a capacity of 600 tons of steel per month.

Fort William, Ont.—A machine shop for the manufacture of stookers or shockers is about to commence operation here. The promoters, the Hammond Stooker Company, have received a bonus of $12,500 from the city.

Lethbridge, Alta.—The Lethbridge Iron Works Company, Limited, will move their whole plant next spring from the present location on First Avenue to the industrial sites purchased by the city in 1910.

Galt, Ont.—Work is being rushed on the Victoria Wheel Works new plant belonging to Thomas and Hancock. The foundation of the machine shop is complete.

Saskatoon, Sask.—The Armstrong Manufacturing Company, of Waterloo, Iowa, manufacturers of well-drilling machinery and gasoline engines, will locate a factory and warehouse here sometime in the near future.

St. John, N.B.—The plant of the Wilson Foundry, owned by Hon. J. E. Wilson, and the plant of the Canada Brush Company, were destroyed by fire with a loss of about $100,000.

North Transcona, Man. Arthur W. Humber and Company are about to commence work on the establishment of a foundry and manufacturing plant. The main product of the plant will be cast iron and steel articles. Gasoline engines, forges, and hoisting machinery will also be turned out.

MUNICIPAL.

Vegreville, Alta.—The ratepayers here recently endorsed a by-law to raise $24,000 for advancement of search for natural gas.

Chilliwack, B.C.—The by-law calling for the raising of $30,000 to be used as a bonus to the McAdam industry received the assent of the ratepayers.

Kindersley, Sask.—The burgesses recently voted in favor of the raising of $90,000 for the installation of water and electric light systems.

Nanaimo, B.C.—The by-law calling for the raisingof $50,000 for improvement of water system was recently sanctioned by the ratepayers.

Belleville, Ont.—The ratepayers have endorsed the by-law to raise $5,000 to provide a site for the Wood Chemical Company.

Lethbridge, Alta.—The ratepayers here recently endorsed the natural gas by-law.

Township of Dereham, Ont.—The burgesses recently endorsed the raising of $4,425 for the purpose of erecting a school house and public school.

Georgetown, Ont.—By a large vote in favor of the by-law recently submitted the ratepayers authorized the raising of $3,200 as a loan to the Georgetown Foundry Company.

Orillia, Ont.—The burgesses have endorsed the borrowing of $25,000 for the purpose of building sidewalks.

Calgary, Alta.—The City Council has passed a by-law which authorizes the raising of $400 000to provide for the construction of a filtration plant.

Gleichen, Alta.—The sewerage and waterworks by-law by which $5,000 is to be raised,

Saanich, B.C.—The ratepayers voted in favor of the school by-law whereby $30,000 will be raised for school purposes.

Ingersoll, Ont.—Two money by-laws were of late, defeated by the burgesses. The by-laws provided for the raising of $57,000 for a sewage system, and $20,000 as a bonus to Thomas Waterhouse and Company.

Victoria, B.C.—The ratepayers endorsed a by-law recently submitted which provided and defeated the city hall by-law which called for the raising of $500,000.

Pembroke, Ont.—The ratepayers have endorsed the by-law authorizing the raising of $25,000 to be granted as a bonus to the Canadian Northern Railway. This is to be a divisional point for the C.N.R.

Port Dalhousie, Ont. The Hydro-Electric by-law was recently endorsed by the burgesses. This will involve the raising of an uncertain sum of money.

Streetsville, Ont.—The by-law recently submitted to the ratepayers to raise $5,000 for additional fire protection was recently carried.

West Vancouver, B.C.—The ferry by-law which called for the raising of $30,000 to be invested in the Vancouver Ferries, Limited, received the endorsement of the ratepayers.

Toronto, Ont.—The city council passed a by-law which calls for the expenditure of $300,000 for a municipal abattoir.

Wingham, Ont.—A by-law to raise $8,000 for the erection of a new town hall was sanctioned by the ratepayers.

Grand Forks, B.C.—The burgesses recently endorsed the by-law to raise $16,000 by debentures for the construction of a reservoir.

Moose Jaw, Sask.—The by-law by which George White & Sons were to receive a bonus from the city was defeated by the ratepayers recently. This is the second time the by-law was voted upon, the vote on May 30th being insufficient to meet the two-thirds requirement.

Prince Rupert, B.C.—Three by-laws, aggregating $121,000, were recently passed by the ratepayers.

Athabasca Landing, Alta.—The ratepayers recently endorsed the raising of $80,000 re installation of waterworks, also the raising of $70,000 for sewage system.

Welland, Ont.—Crowland Township, which consists of Welland industries, passed five by-laws recently. These are as follows:—Granting fixed assessment to Welland Terminals; granting switching privileges to the Canadian Northern Steel Company; granting fixed assessment to Canadian Northern Steel Company; granting switching privileges to Welland Terminals; and granting General Securities gas and electric services.

Moose Jaw, Sask.—It is reported that the municipal Board of Trade are considering plans for the erection of a new office building suitable for their business needs.

Niagara Falls, Ont.—Messrs. Henry Hope and Sons, of Birmingham, England, have opened negotiations with the municipal council regarding the erection of a branch plant at this point.

ELECTRICAL.

London, Ont.—The Bell Telephone Company took out a building permit recently for an addition to its present plant to the extent of $45,000. The new building will be of red brick, and situated at the north of the present building.

Toronto, Ont.—The nine-mile extension of the Toronto suburban radial from Weston to Woodbridge has been delayed, owing to the refusal of the iron foundries to accept orders for the bridges on short notice; thus the contemplated completion in October is put off till next year when the line will be in operation.

Lethbridge, Alta.—The rural telephone line to the west of Carmangay will be completed shortly. There will be twenty phones on this line which will be divided into two circuits—one with nine phones and the other with eleven.

Carora, Sask.—The North Western Electric Company, of Regina, have been awarded the contract to install an electric light system in this town at a cost of $20,000.

Peterboro, Ont.—An explosion at the plant of the Canadian General Electric Company caused serious damage. The sub-station was partially wrecked.

Salmon Arm, B.C.—Tenders have been called for construction of the Power House and supply of the units for the electric light system to be installed.

GENERAL MANUFACTURING.

Penticton, B.C.—Considerable headway is being made with the new cannery about to commence operations here. Four carloads of cans have been received, and everything is ready to commence. About sixty hands will be needed. The output per day will be about 10,000 cans.

New Westminster, B.C.—Another new industry is about to commence operations here in the shape of a wagon factory. The company behind the movement is the North-west Wheel and Wagon Company, with head office at Bellington, Washington.

Medicine Hat, Alta.—F. P. Jones, general manager of the Canada Cement Works states that it is the purpose of the company to establish a cement plant here.

Pembroke, Ont.—A Hamilton firm is seeking aid of the towns in the erection of a box factory. The company is capitalized to employ 90 to 100 men if the town will grant a free site and exemption from taxes.

St. Thomas, Ont.—Deals have recently been closed with two firms. One, E. E. Donovan, of London, will start a shoe factory in return for a loan of $12,000, and the other, the Steel Grave Vault Company, of Gallion, Ohio, will erect a factory on a free site.

St. Thomas, Ont.—The St. Thomas Dehydrating Company has recently been organized here with local capital for the purpose of dehydrating and evaporating fruits and vegetables. A canning factory has been purchased from the Canadian Canners.

Peterborough, Ont.—The Canadian McIntyre Automobile Company is seeking to establish a factory here. The company is asking aid to the extent of $2,346. The question is now before the ratepayers.

Pembroke, Ont.—The Dunlop and Company firm, owing to lack of space, are enlarging their store by 1,000 square feet. This will enlarge the store to one third more than the present capacity.

Brantford, Ont.—Negotiations have been concluded here for the establishment of the Keeton Automobile Company, with a capital of $200,000. It will employ 200 hands and will commence operations immediately.

Montreal, Que.—Fire recently caused a loss of $100,000, when the box factory of Myers Thomas Company, of Granby, was burned. The insurance amounts to $54,000.

Belleville, Ont.—The Wood Chemical Company of Canada recently were granted a $5,000 site and limited fixed assessment for ten years on condition of the aforementioned firm starting $150,000 of buildings in three months.

Haileybury, Ont.—Plans and specifications are now about complete for the erection of a factory for the manufacturing of cheddite, by the Energite Explosives Company.

Melfort, Sask.—John F. Hansen, recently returned from England, where he raised $4,000,000 for Western development, intends to start a sugar beet factory here soon, and to build a plant next spring.

Calgary, Alta.—With the object of forming a company for the manufacture of tar paper, several local business men held a meeting recently. No definite results are known yet concerning the outcome of the meeting.

Medicine Hat, Alta.—Excavation work has commenced on the new mill being built here by the Medicine Hat Milling Company.

Fort William, Ont.—The Berlin Bedding and Mattress Company, of Berlin, Ont., are to start work on the erection of a plant, which received the sanction of the ratepayers at the last election.

Calgary, Alta.—The management of the Union Fibre Company, of Winona, Minn. U.S.A., will erect a branch factory in this city at a cost of $250,000.

Niagara Falls, Ont.—The management of the Visor Knitting Company, of Niagara Falls, New York, will, in all probability, open a branch plant at this point in the old armory building. Considerable alterations will be necessary to the building.

Regina, Sask.—A report states that the management of the Canadian American Egg Company will establish a branch plant in this city. The members of this company state that they have received from Denmark particulars of a system that will keep eggs fresh for a period of two years. Mr. Hammer is president of this concern.

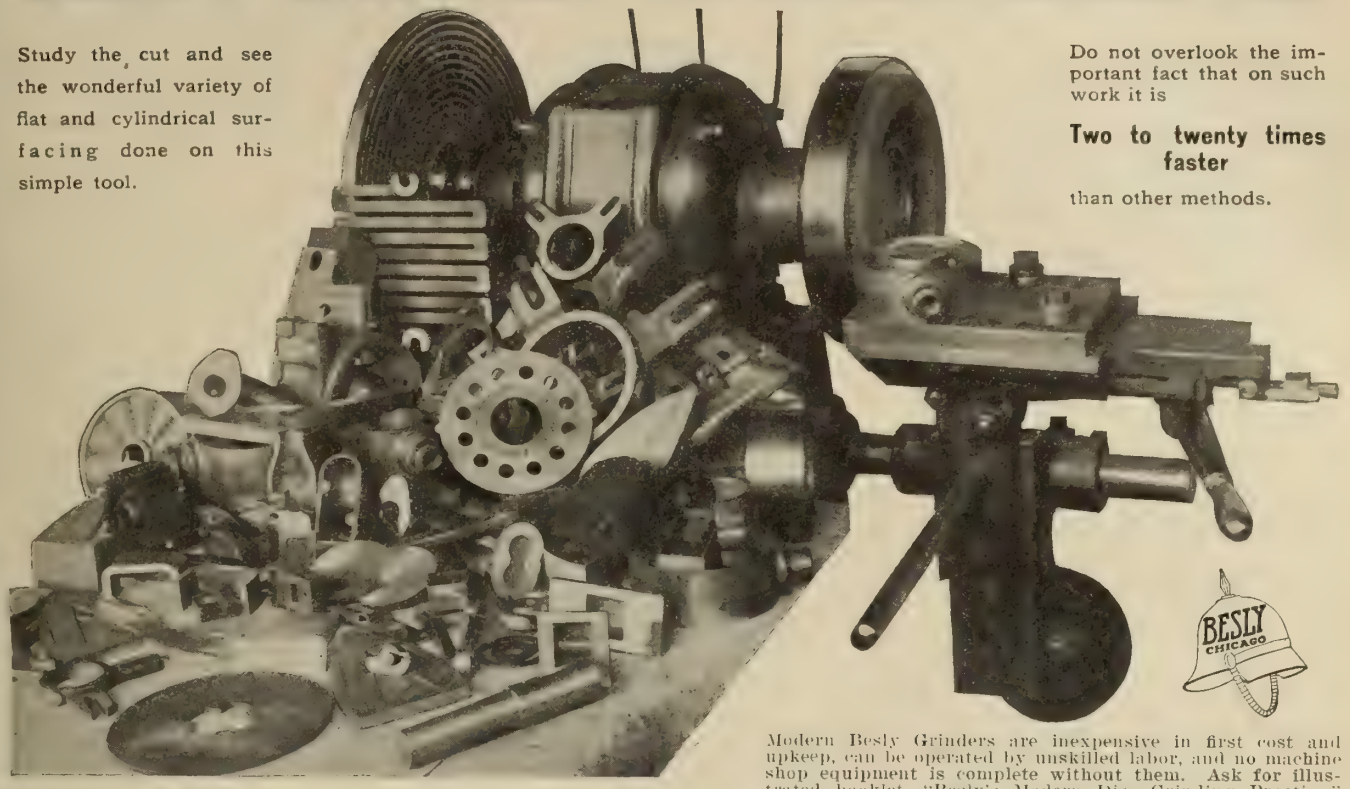
BESLY GRINDER—The Versatile Machine Tool

Study the cut and see the wonderful variety of flat and cylindrical surfacing done on this simple tool.

Do not overlook the important fact that on such work it is

Two to twenty times faster

than other methods.



Modern Besly Grinders are inexpensive in first cost and upkeep, can be operated by unskilled labor, and no machine shop equipment is complete without them. Ask for illustrated booklet, "Besly's Modern Disc Grinding Practice."

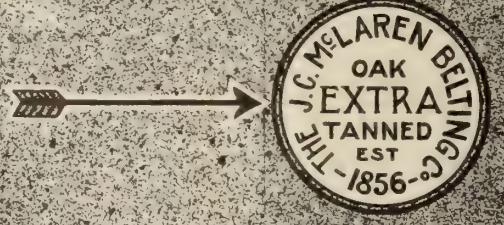
BEST LEATHER BELT MADE



TORONTO ST. JOHN, N.B. MONTREAL WINNIPEG VANCOUVER

Coquitlam, B.C.—The Call Switch Co., Coquitlam, B.C., has purchased a site at Coquitlam and will erect a manufacturing plant to cost $200,000.

Coldbrook, N.B.—The contract has been awarded for the construction of a new plant for the manufacture of automobiles, for the Maritime Motor Car Co., Ltd., at Coldbrook, N.B. There will be three buildings of brick and concrete.

St. Catharines, Ont.—The Ritter Illuminating & Mfg. Co., St. Catharines, Ont., will erect a new factory for the manufacture of electrical devices. G. B. Burson, St. Catharines, is manager.

Galt, Ont.—The Galt Furnace & Stove Co., Galt, Ont., will double the capacity of its plant.

Toronto, Ont.—The Central Garage & Supply Co., Ltd., Toronto, Ont., recently incorporated with a capital of $150,000, will erect a plant for the manufacture of automobiles and engines. Robert B. Haley and Royden J. Haley are interested.

Oshawa, Ont.—The Hacket Motor Co., Ltd., Oshawa, Ont., recently incorporated with a capital of $350,000, will equip a plant for the manufacture of motors and gasoline engines.

PLANING MILLS AND SAW MILLS.

Macleod, Alta.—It is reported that Mr. Greig, the manager of the Standard Lumber Company, of Toronto, is about to establish here a new lumber and pulp plant. It is proposed to employ 200 men. Major Peuchen is head of the company.

Belleville, Ont.—Fire recently visited the sash factory of Peek and Wills here. The factory which was a large frame structure, was damaged to the extent of $20,000. The cause of the fire is unknown. Very little insurance was carried.

Marysville, N.B.—The Partington Pulp and Paper Company has started their mill in operation here. The sawing of the season's cut has commenced, and about 12,000,000 feet will be sent to the pulp mill at St. John.

Melville, Sask.—A sash and door factory is asking for a free site, power at cost, tax exemption, and a loan of $40,000, to locate a plant here.

Montreal, P.Q.—About $60,000 damage was caused by fire to the plant of the sash and door factory of Mr. Walter Reed.

Newville, N.S.—The buildings and plant of the Newville Lumber Company, were destroyed by fire with a loss of $20,000. This place is ten miles from Parrsboro.

Hamilton, Ont.—The Long Lumber Co., 28 James St., Hamilton, Ont., is planning to build a new box factory. The estimated cost is $150,000. Guy Long is manager.

Guelph, Ont.—The Guelph Carpet Mills, Guelph, Ont., are preparing plans for the erection of another large addition to their mills.

Walkerton, Ont.—The Canada Furniture Co., Walkerton, Ont., plans to double the capacity of its factory. Plans will be prepared at once.

Granby, Que.—The box factory of the Myers Thomas Co., Granby, Que., which was recently destroyed by fire with a loss of $150,000, will be rebuilt, and new machinery will be installed. Noted Aug. 22.

Ayers Cliff, Que.—W. Hunting, Massawppi, Que., will erect a new sash and door factory at Ayers Cliff, Que. Complete new machinery will be installed. Bids will soon be received.

Edmonton, Alta.—The Cement, Stone and Brick Co., Calgary, Alta., plans to establish a branch factory at Edmonton, Alta. Hiram Sykes is manager.

North Battleford, Sask.—The Union Supply Co., North Battleford, Sask., will have plans prepared at once for the construction of a large new flour mill. New machinery will be installed. W. Kloehm, Battleford, is manager.

Dalhousie, N.B.—The sawmill of the Sydney Lumber Co., Dalhousie, N.B., was destroyed by fire Aug. 18.

Dalhousie, N.B.—The shingle mill of Allen Hicks, at Dalhousie Junction, Dalhousie, N.B., was destroyed by fire Aug. 17. Loss, $6,000.

Fairview, B.C.—Fire destroyed Hatch Bros.' sash and door factory at Fifth Ave. and Cedar St., Fairview, B.C. Loss, $45,000.

Port Hammond, B.C.—The Port Hammond Lumber Co., Port Hammond, B.C., will build a lath mill in connection with its sawmill plant.

BUILDING NOTES.

Lethbridge, Alta. A monster convention hall is about to be erected here for the Dry Farming Congress. It will cover a space of about 200 square feet and will have a seating capacity for 2,500 persons. Further specifications are not made known yet.

Montreal, Que.—Plans are now about complete for the erection of a new warehouse for the Customs Department. It is to be built on McGill St., at a cost of $75,000, and will be seven storeys high.

Rosthern, Sask.—The Union Supply Company has started work on the new $25,000

flour mill here. The contract for the building which is to be 34 x 50 feet, four stories high, has been awarded to Sanderson and Thompson.

Vancouver, B.C.—The Vancouver Club to be built on Hastings Street is to be five storeys high and will contain excellent accommodation. There are to be three entrances to the building, all facing on Hastings Street. Messrs. Sharpe and Thompson are the architects.

Regina, Sask.—The new isolation hospital, and also a laundry and power house in connection with the general hospital, will be built this year. The isolation hospital is estimated to cost $55,000, whilst the laundry and power house will cost about $40,000.

Nanaimo, B.C.—The Canadian Pacific Railway is rapidly linking McBride Junction, near here, with Courtenay, in the Comot district. The contract for the construction of the same has been awarded to Messrs. Culleton Bros., of Spokane.

Edmonton, Alta.—The Royal Bank of Canada is erecting a new building on Jasper Avenue here. It is to cost about $100,000, and will be four storeys high. The structure will be fireproof throughout, being of steel with concrete and brick reinforcements. The front of the building will be adorned with six fine Corinthian pillars, having ornamental tops. Kenneth G. Rea, of Montreal is the architect, and Purdy and Henderson, Vancouver, the contractors.

Vancouver, B.C.—The plans for the proposed hippodrome which is to be erected at the corner of Granville and Pacific Streets here shows the building is to be of a very handsome structure. Plans for the interior call for sixteen private boxes and also every modern accommodation for comfort; viz., sitting-rooms, retiring-rooms, smoking-rooms, etc. The total seating capacity will be for 3,000 persons. The structure will cost about $500,000.

Winnipeg, Man.—The McCallum Hill building, to be built at a cost of $320,000 will be one of the finest of this city. It will be of steel frame construction, with tile partitions, and will be as absolutely fireproof as it is possible to make it. It will be eight storeys high with provision to carry two additional storeys.

Calgary, Alta.—Plans for the Government new immigration building shows it is to be 42 by 62 feet, and three storeys high. It will cost $50,000.

New Westminster, B.C.—The contract for the erection of the Royal Columbian hospital has been signed by Messrs. A. D. Rison and Dill, who were the successful tenderers for same at a price of $135,000.

Calgary, Alta.—Senator Lougheed has announced his intention of building another vaudeville house here at a cost of $100,000.

Toronto, Ont.—Hon. Adam Beck has announced the intention of merging his four box manufacturing plants which are established at Montreal, Toronto, Hamilton, and London, into one. This will henceforth be known as the Beck Manufacturing Company. The consolidation of these different concerns will cause the construction of a new building on Wilton Avenue, here, to cost about $600,000. A feature of this change is the introduction of a new idea of co-operation.

Moose Jaw, Sask.—Excavation is started on the new theatre to be built here. It is being built for W. B. Sherman, who has already ten theatres in the Canadian West; this one is to cost $150,000.

Winnipeg, Man.—The new seminary for "La Corporation Archiepiscopale Catholique Romaine de St. Boniface," is nearing completion and will be ready for occupancy in about six weeks' time. It is four storeys high, and will cost $125,000. J. H. Tremblay and Sons are the contractors and J. O. Turgeon, is the architect. The building is said to be one of the most magnificent in Canada.

Vancouver, B.C.—The contract for the building of the Dawson school has been let to the Canadian Ferro Concrete Company. The structure, according to the tender, will cost $122,000.

Toronto, Ont.—The plans for the experimental sewage disposal plant have been drawn and approved, and the construction of the same will commence at once.

Wainwright, Alta.—The contract for the erection of the new fire and town hall has been awarded at a cost of $10,000. Work will commence at once.

MISCELLANEOUS.

Calgary, Alta.—The draughting department of the Canadian Northern Railway are in possession of plans for a proposed hotel to be erected in this city at a cost of $1,000,000.

Edmonton, Alta.—The Jesuit Order announces that it will found a college in this city. Father Jean and Hudon, of St. Boniface College, Manitoba, are in charge of the preparations.

Edmonton, Alta.—The municipal commissioners are considering plans for the erection of a new market.

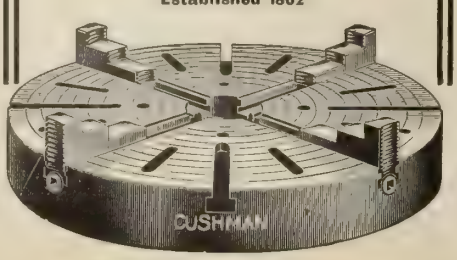
The Cushman Chuck Co.
Hartford, Conn., U.S.A.
Established 1862



Montreal, P.Q.—Messrs. Ashmore, Benson, Pease & Co., Ltd., of Stockton-on-Tees, England, have been given an order by the Montreal Light, Heat and Power Company to supply and erect at their Outremont station a four lift gasholder of 3 million cubic feet capacity and a steel tank to contain the same. The tank is 184 feet in diameter, and 31 feet deep, while the gasholder has four lifts and will be guided by steel lattice standards and girders. It is expected that work in connection with the erection of the tank will begin soon. The foundations have been prepared by the Montreal Light, Heat and Power Company. The Canadian-British Engineering Co., Ltd., of London, Eng., and Toronto, are the Canadian representativeh for Messrs. Ashmore, Benson, Pease and Co.

Halifax, N.S.—The Nova Scotia Car Works have received an order from the C.P.R. for five hundred steel box cars. The company recently just finished an order for 250 steel cars for that road.

Galt, Ont.—Messrs. W. D. Sheldon, J. F. MacGregor and Allen Hills, all of this town, are interested in a new project of the Hare Engineering Company. $400,000 of capital stock in this company has been taken up in Great Britain and the company will now erect a plant to manufacture power equipment and pulp machinery. The plant to be erected in this town will cost about $150,000.

Kingston, Ont.—The management of the Canadian Locomotive Company are about to erect several residences for the mechanics employed by them. Fifteen double houses are to be built before the winter months.

Moose Jaw, Sask.—The Moose Jaw Steam Laundry have taken out a permit for the erection of an addition to their plant. There will be considerable machinery necessary for the work to be conducted in the new wing. The cost of the building will be about $10,000.

Montreal, P.Q.—A large glass factory will be erected in Montreal West near the Canadian Pacific Railway's new yards. There will be about 600 men employed when this industry commences operations.

Toronto, Ont.—Sealed tenders will be received by E. R. C. Clarkson, at his offies, 33 Scott Street, Toronto, Canada, up to twelve o'clock noon, of Wednesday, September 11th, 1912, for the purchase of the Sheet Steel Mills and equipment, formerly owned and operated by The Canada Tin Plate and Sheet Steel Company, Limited, and The Canadian Sheet Steel Corporation, Limited, at Morrisburg, Ontario, Canada. Further particulars may be obtained from the above.

CATALOGUES RECEIVED.

The Newton Machine Tool Works, Incorp., Philadelphia, Pa., have issued Catalogue No. 47, dealing with the firms well known line of cold saw cutting-off machines. These are shown in all sizes for every variety of work. The catalogue is well printed and profusely illustrated. Parties interested are requested to mention No. 47.

The Mesta Machine Co., Pittsburg, Pa., have issued an attractive little booklet illustrating their plant and some of its products. The latter consist principally of machinery for steel works, blast furnaces and power plants, consisting of gas and steam engines, barometric condensers, air compressors, steam-hydraulic forging and bending presses, rolling mill machinery, etc., etc. The only limit to the size and weight of machinery they build is that imposed by the limits which the railroads can handle. Castings weighing over 100 tons have been made in their foundries and finished in their machine shops. The booklet is well illustrated by a large number of half-tones, which give one an excellent idea of the extent of this large plant and of the heavy work there turned out.

Bruce, Peebles & Co., Ltd., Edinburgh, Scotland, have mailed us a pamphlet which they have recently sent out. This new pamphlet (No. 21B) deals with medium size self-contained type continuous current dynamos and motors. In the beginning of the publication is given a specification of the various types, while farther on are to be found ratings and efficiencies of the different frame sizes at standard voltages for protected, semi-enclosed, and totally enclosed machines. The pamphlet also gives approximate weights and dimensions of all the machines listed.

The Smart Turner Machine Co., Ltd., Hamilton, Ont., have issued catalogue No. 8, an extremely well gotten up little book devoted to steam pumps, of designs and sizes ordinarily called for. The firm, of course, also build special pumps of all sizes and types to meet any conditions. Those desiring information on power pumps should ask for catalogue No. 7.

W. Sisson & Co., Ltd., Gloucester, England, have forwarded a bulletin descriptive of their jet condensing plants for power installations, with which they have been meeting with much success.

FOUNDRYMEN'S CONVENTION AND EXHIBITION.

THIS combined function to be held in Buffalo, N. Y., during the week of September 23, already gives indication of eclipsing not only all previous gatherings, but of relegating to positions of secondary importance, similar conventions and expositions of any other mechanical industry. Such a condition of affairs denotes the enthusiasm displayed by the various units of the craft in their profession, and is at the same time a compliment to the administrative bodies directing the different sections. The undermentioned exhibitors have already reserved space in the Exhibition Hall:

¶ These are the men you want to reach with your advertising.

¶ There is a reason why CANADIAN MACHINERY AND MANUFACTURING NEWS is THE medium you should use in a large way to reach these men.

¶ Given a good journal—well edited, illustrated and well printed, the paid-up circulation would be small were not a vigorous campaign carried on, both by mail and personal work.

¶ CANADIAN MACHINERY is well edited, well illustrated and well printed—the one source in Canada of timely, reliable, first-hand information to mechanical men.

¶ But we are not satisfied with simply publishing a good journal. Our thoroughly-trained, salaried subscription men are out hustling for subscriptions in every province of Canada—and getting the business, or we want to know the reason why. In addition, we are represented in practically every railroad shop and other large shops by special agents, who are well paid for every order sent in—and every mail brings orders from these men.

¶ No machine shop, foundry or metal working shop of any class, whether large or small, is overlooked by our subscription plan.

¶ Above is one GOOD reason why you should not overlook this journal as your strongest aid to more business in 1912. There are many others.

Want to talk it over? Write us.

—⚙—

In speaking of increasing efficiencies in workshops, a prominent shop manager says that manufacturers are just beginning to resolve into first principles the various manufacturing processes of their finished products. They have yet to apply this analysis in exactness to the problem of machine efficiency in the manufacture of their products. He stated that he believed that there is a lack of knowledge of the possibilities of the most common type of machine tools in every shop; in fact there is not one shop in 10, in which the possibilities of even the engine lathe are thoroughly understood.—Ex.

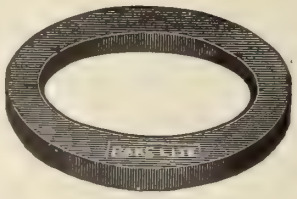
These are the telling points about

Bakelite

Valve Discs



They will not leak under high temperature, excessive pressure or when used in acids or other special liquids. Neither cold water, dry or superheated steam has the least effect upon them. **BAKELITE** Discs are a gas-tight fit.

BAKELITE is a successful substitute for expensive metal. Its structure is fibrous, giving strength and hardness. It can be reground and refaced, always retaining a uniform surface. It cannot be injured, except by accident or friction. Remember Bakelite **PUMP VALVES** do not warm with changes of temperature.

Order your valves fitted with Bakelite Valve Discs and stop that perpetual annoyance and expense caused by leaking valves. Depend upon it, Bakelite Valve Discs will not leak.

WRITE FOR PRICES OR ASK YOUR DEALER.

YOU WANT TO IMPROVE YOUR POSITION

THEN READ THE

LIFE OF JAMES WATT

INVENTOR OF THE STEAM ENGINE

By ANDREW CARNEGIE

An entertaining book for those interested in mechanics and power, dealing with the scientific and mechanical inventions of Watt's life and times and his relations with other noted scientists and inventors.

The author, as a practical engineer, possesses all the technical knowledge necessary to give actuality to his writing, and his book is alive with enthusiasm and appreciation. He has missed no point in the romance of Watt's career, with its many thrilling episodes and its study of human nature revealed in a realistic manner. Mr. Carnegie may not point out how to become a millionaire, but he certainly sets forth considerations which may help to influence many a working man to improve his position.

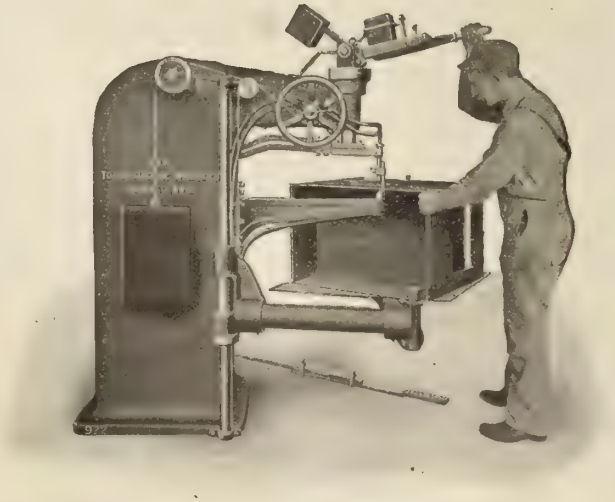
ELECTRIC WELDING

Takes the Place of Riveting



No. 150 STOVE WELDER

It's 50 to 80 per cent. cheaper than riveting.
It's 60 per cent. stronger than rivets.
No holes to punch—No rivets used.

SEND US A SAMPLE

of the work you are now riveting. We will weld it and return to you (free). Then go at it with a sledge hammer and pound it. Don't be afraid of breaking anything except the hammer. Then find out how little it costs to do the work and decide whether you can afford to do without a welder.

Bulletins telling all about them—free. Just your name and address.

NO LEASE. NO LICENSE. NO ROYALTY.

BROKEN CASTINGS

REPAIRED

Never allow your plant to be idle waiting for new castings.

Idle plant costs money, send us your work and save it.

We weld any metal or combination of metals. We cut down steel work such as wrecked bridges and buildings.

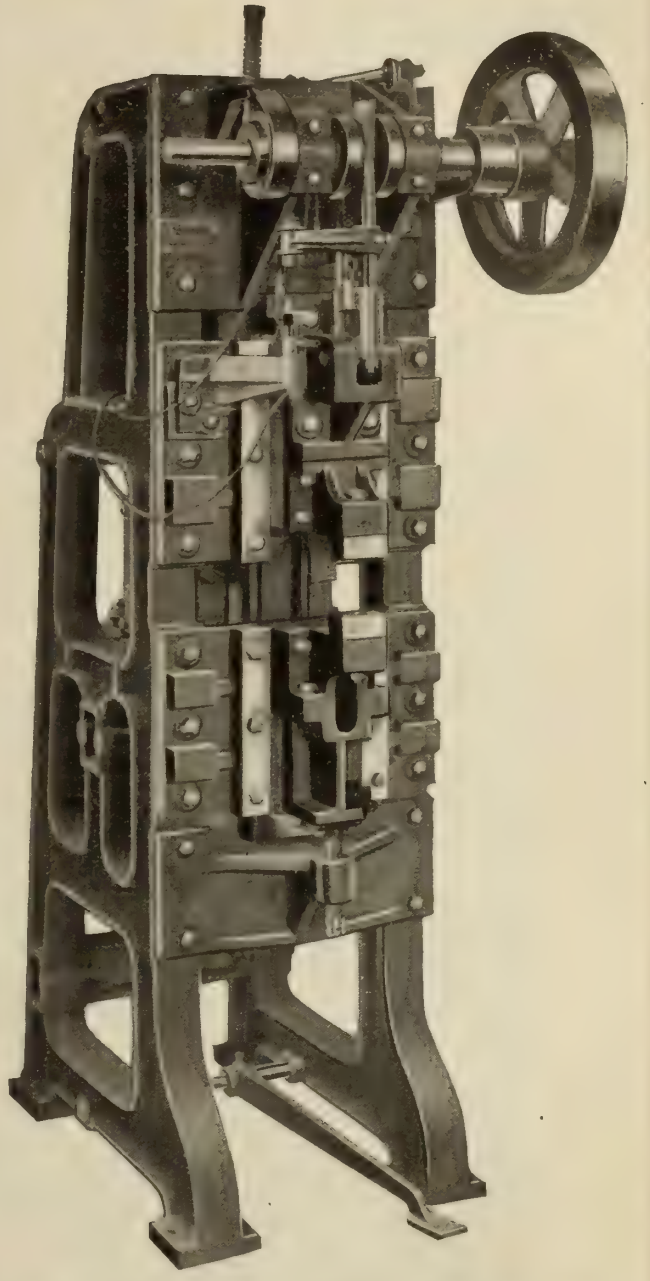
INQUIRIES SOLICITED.

The Dominion Oxygen Welding and Cutting Co.

21 Queen Street, MONTREAL.

L. Vigoureux, Manager. Phone Main 7192.

WELD by Electricity



Our machines are not TOYS. They are made for service.

CHEAPEST, QUICKEST and BEST

Why buy an imitation, when you can secure the original?

We are not limited to thin metal only, but can handle heavy as well as light, and both on the same machine.

Write for particulars, or send samples or even sketches, and we will be glad to quote you on your requirements.

Standard Three-Motor Electric Overhead Travelling Crane

We build Cranes of all kinds---of all sizes---for all purposes.
This is our Standard Three-Motor Overhead Travelling Crane.

¶ All parts well proportioned and of rigid construction, giving large factors of safety.
¶ Over-winding device. Gears all machine cut. All parts standard and interchangeable.
¶ Fitted with liberally-rated, slow-speed motors and improved tramway type controllers.

Detailed Specifications and Prices submitted upon request.

CANADIAN MACHINERY and MANUFACTURING NEWS

TORONTO

TWENTIETH CENTURY MACHINE SHOP PRACTICE

by L. E. Brookes

This book is intended for the practical instruction of machinists, engineers and others who are interested in the use and operation of the machinery and machine tools in a modern machine shop $2.00

PRACTICAL MECHANICAL DRAWING AND MACHINE DESIGN SELF TAUGHT

by Chas. Westinghouse

A complete self instructor on drafting tools, geometrical drawing, mensuration, of plane surface and volume and surface of solids, the development of curves, surfaces, etc. A large section is devoted to machine drawing, including boiler and tank work, engine pillow blocks, pulleys, gear wheel designs, etc. $2.00

PATTERN MAKING AND FOUNDRY PRACTICE

by L. H. Hand

The making of castings is clearly described, the tools used by pattern-makers described and illustrated, and instructions regarding their use are given, and the process of making patterns is then taken up $1.50

TECHNICAL BOOK DEPT.

MacLean Publishing Co., Limited

143 UNIVERSITY AVENUE, TORNOTO

"MORSE" DRILLS AND MACHINISTS' TOOLS

A kit of "MORSE" TOOLS is a good investment and a safe one. They not only pay for themselves in a short time, but the interest on the amount expended accumulates rapidly by the satisfactory work accomplished by them.

Carbon and High Speed Steel Tools

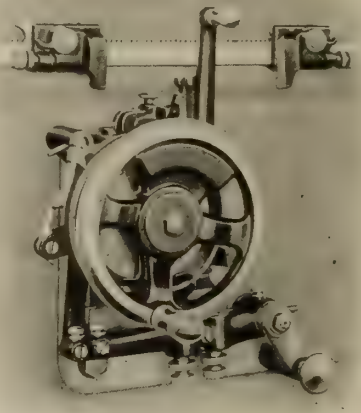
"Morse" Drills and Tools are handled by:—Rice Lewis & Son, Limited, Toronto; Aikenhead Hardware, Limited, Toronto; Frothingham & Workman, Montreal; Mechanics Supply Co. Quebec.

MORSE TWIST DRILL & MACHINE CO.

New Bedford Mass., - U.S.A.

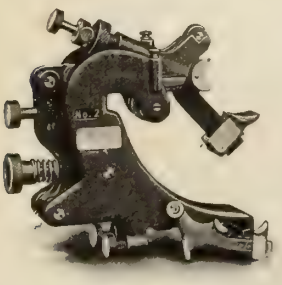
From the Business Man's Viewpoint—

a large commercial production is very desirable. Yet accuracy should not be sacrificed to gain it. It need not be with



B. & S. PLAIN AND UNIVERSAL GRINDING MACHINES

THE AUTOMATIC CROSS FEED automatically controls grinding of work to any predetermined size. Needs no attention when once set. Workman can often operate several machines. One-quarter thousandth of an inch removed as easily as a thirty-second of an inch.



THE UNIVERSAL BACK REST automatically follows work down to size and then prevents it being ground under size. Can be finely adjusted. Heavy commercial cuts can be safely taken, as work cannot wedge.

BROWN & SHARPE MFG. CO., Providence, R.I., U.S.A.

Dominion Bridge Company, Limited

MONTREAL

THE ENGINEER'S FRIEND

If SHAKESPEARE were alive and saw our advertisements he might exclaim, "How appropriate is that quotation," but if he knew the good qualities of

HARRIS HEAVY PRESSURE

(THE BABBITT METAL WITHOUT A FAULT)

he would appreciate the use made of his immortal writings.

H.H.P. is a High Grade Babbitt at a Medium Price.

If your dealer cannot supply you, order from our nearest factory.

To what base uses we may return,
Imperious Caesar being dead and turned to clay,
May stop a hole to keep the wind away.
—*Hamlet.*

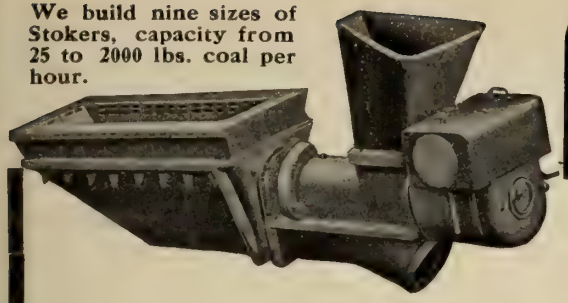
We build nine sizes of Stokers, capacity from 25 to 2000 lbs. coal per hour.



Write Now!

Our Furnaces Heat Steel with the Cheapest Fuel on Earth—

SOFT, SLACK COAL

They are all fired with "American" Mechanical Stokers, which burn bituminous slack coal automatically and without smoke, and give a clear, steady, soft, non-scaling flame. You get increased production, at about one-third to one-half the operating cost of oil or hard coal. This is a fact. If you burn money to heat steel why not burn less of it, and write us at once?

The Hare Engineering Co., Limited

14-16 King Street East, Toronto, Canada

CASTINGS

IRON CHROME NICKEL MANGANESE } **STEEL**

We absolutely guarantee quality. We ha ve only expert moulders. We exercise great care in pouring.

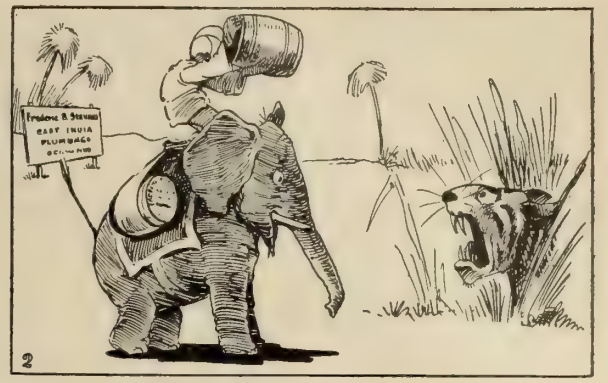
Dixon Crucibles

EVERY crucible made by DIXON since 1827 has been made with the one idea of giving reliable service.

¶ In doing this nothing has been so helpful as our experience and our study of actual foundry conditions. ¶ In the purchase of raw material, in mixing it correctly, in spinning up the crucible, wherever there has been any question our experience has been called upon to give the final answer.

¶ Write for our booklet No. 223-A on the care and use of crucibles.

Joseph Dixon Crucible Company
Jersey City, N. J.



On the Defensive!

There are times when the Foundryman is on the defensive.

It is when the tiger of competition is too self-assertive.

In the reduction of costs a new profit is created.

Stevens' Pure Plumbago reduces cost

One New York Foundryman writes:—

"Your Lead gives me the best peeled castings I have had for a long time, and the color is right, too."

That means that this Lead does the work expected in the Foundry instead of leaving it for the scratch-room or the chipping room to finish.

That means labor saving and cost saving.

Each shipment has its return ticket—it may be returned and freight paid by me both ways when not satisfactory.

The entire risk is on me!

Its use squelches all tiger danger.

I manufacture the entire line of **Foundry Facings and Foundry Supplies**, and the quality stamp impresses them all.

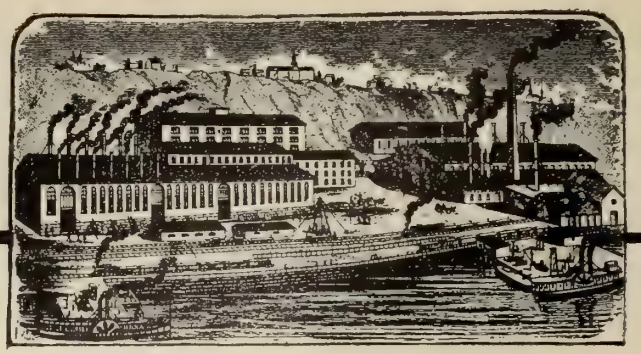
MARINE ENGINES and PUMPS. SHOE MACHINERY A Specialty



BRASS and IRON CASTINGS. BOILERS and REPAIRS.

That we have exceptional facilities at our disposal for the manufacture of all kinds of Machinery —in addition to our business as Brass and Iron Founders, General Contractors and Shoe Machinery Engineers—has been amply proved this year. In the short space of five months, we built and installed all the Engines and Boilers of the new sister steamers "Levis" and "Lauzon," whose trial trips were a complete success. We make a specialty of all kinds of Marine Engine Work, and shall be glad to quote for first-rate products only.

SHOE MACHINERY. Manufacturers of "Non-Royalty" Machines, Metallic and Goodyear, "Fortuna" Skivers, and "Climax" Presses, Sand-papering, Lasting and Loose Studding Machines.

Wire of every description for Slugger and Standard Screw Machines.

The Canadian General & Shoe Machinery Company, Ltd.

ERNEST CARON, Managing Director

LEVIS, Quebec

All Sizes, 1-4 lb. to 30,000 lbs.

We make new process converter steel castings, annealed and unannealed.

We also make Chrome Manganese and Nickel Steel Castings.

DESCRIPTION

Length over all, 5 feet 6 inches.
Height to centre of shaft, 38 inches.
Weight, 375 lbs.
Length from end of spindles to tight collar, 7 inches.
Length of Spindles, 30 inches.
Diameter of Spindles, 1⅜ inches.
Diameter of Spindles for wheel, 1¼ inches.
Tight pulleys, 5¼ inches.
Loose pulleys, 5 inches.
Crucible steel spindles.
Bearings extra long and babbitted with Phoenix babbit metal.
All bearings carefully scraped.
With or without Shifter.
Slight extra changes to meet special requirements without extra charge.
Fitted with Compression Oil Cups.
Pulleys turned inside and out and carefully balanced.
Strong and durable and made for extra hard usage.
A strictly high-grade machine and fully guaranteed in every respect.

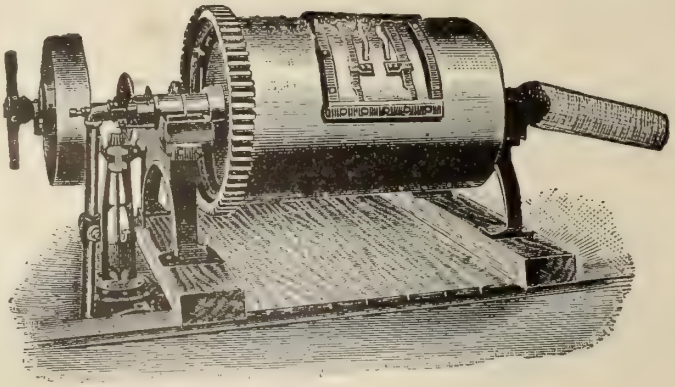
A GOLD MINE

SAVE YOUR IRON



SLY'S PATENT IRON CINDER MILL
Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the iron contained in your cupola dump and gangway scrapings and 75% of the coke. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

THE W. W. SLY MFG. CO., CLEVELAND, O.

ELIMINATE LOSS

SHELTON METALLIC FILLER

will allow you to make a *good profit* on every casting that comes from the mold.

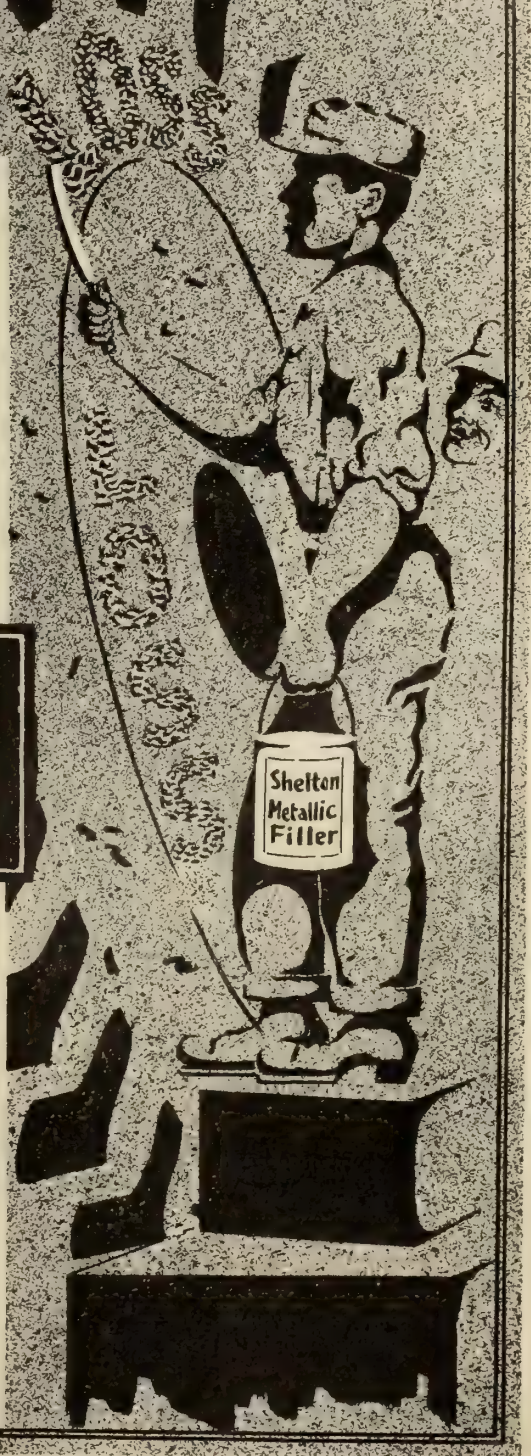
It will allow you to ship every casting in perfect condition, without even the slightest flaw.

It will allow you to ship every casting *right on time*---no delays or explanations to make.

IT IS A GUARANTEE OF MANY HIGHLY PLEASED CUSTOMERS---customers that will surely come back to you and stay with you, increasing your list of permanent and profitable patrons.

Don't neglect to order it.

PERFECT CASTINGS



SHELTON METALLIC FILLER

is being widely used by up-to-date Foundrymen

It is guaranteed to fill in and completely obliterate blow holes, sand holes, etc. It becomes part of the casting itself, being as durable, and cannot be detected. It has been used with great success for many years.

Every casting means a profit if you use Shelton Metallic Filler.

Write us at once.

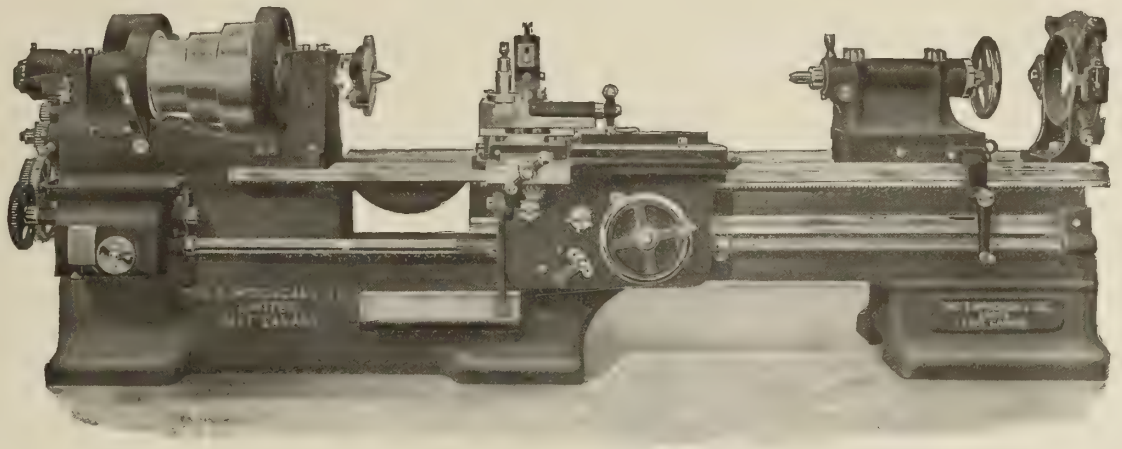
This Equipment is as Handy as a Small Lathe--Use It



THE new McDougall Gap Lathe combines two supremely important factory features. It is massive and solid throughout. This means long wear, quality of output, great capacity.

The other feature is speed of adjustment. We have given every attention to the important problem of cutting down the adjustment time and lengthening the time of actual cutting.

The tailstock is adjustable by means of four top bolts. This avoids crawling under the bed to move the tailstock.

The tailstock sleeve has a quick-acting clamp locking device.

Half the inconvience of a lathe lies somewhere around the tailstock. It is hard to handle changes of length. With the McDougall Gap Lathe these changes are a matter of only a minute or two.

With this kind of adjustment at your workman's easy command, tool adjustment and the compound rest are also made easy and quick.

The rest reads to thousandths of an inch both ways. The bed is non-springing. The headstock is massive and solid, with large bearings throughout.

This gives absolute accuracy of tool adjustment and perfect quality of cut—smooth, clean and even.

The workman has at his command eighteen changes of spindle speed. He can always run his tool at the limit of cutting speed at any radius. His tool is protected by a safety feed device which prevents both feeds being in operation at one time.

In practice this means speedy output, because the tool is almost instantly ready for the cut, and cuts to the set limit at the highest cutting speed desirable for the material in the lathe.

A tool that turns out large work with the same adaptability to quick changes and accurate finishing found in small lathes for small work—that is the McDougall Gap Lathe.

It is a money earner in your shop, because it is a saver of 'dead' time, and utilizes every device to do efficient finishing, accurate to a hairsbreadth, at the time it also does the rough turning required for the part.

This is very close to the ideal condition for economical machining with the lowest fixed charges, lowest labor cost and highest shop profits.

We would like to take the installation of this equipment up with you in detail. We have a range of beds and gap capacities in the McDougall Gap Lathe. We want you to write us, so we may quote you, and "show you" as well. Why not write us now?

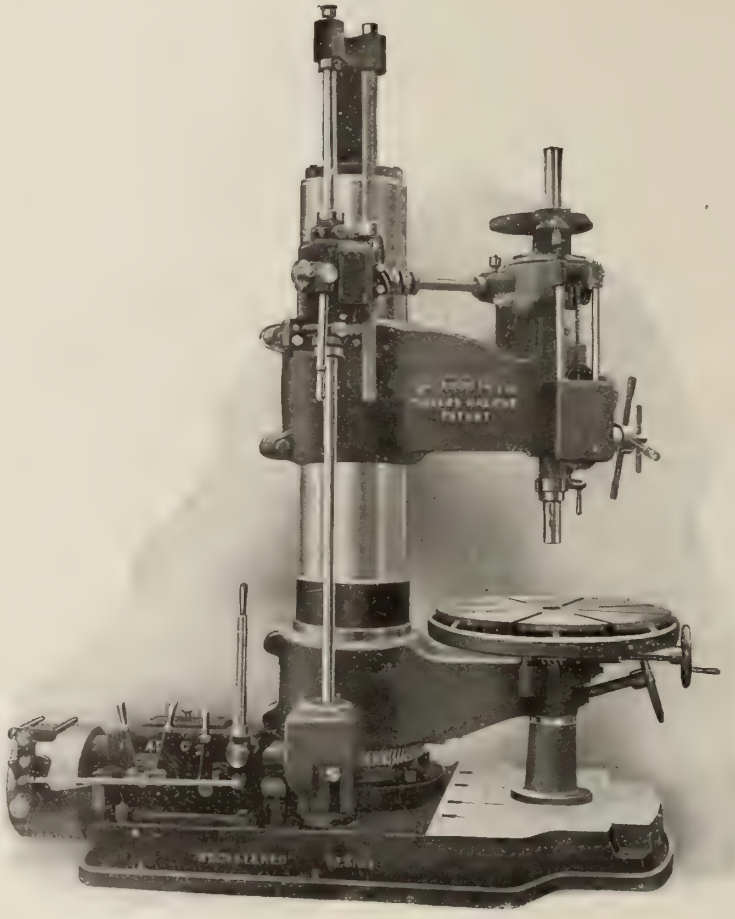
ASQUITH

IMPROVED PATENT HIGH SPEED VERTICAL DRILLING, BORING, TAPPING and STUDDING MACHINES

Great Rigidity and freedom from deflection in either frame or table.

Unequalled Handiness of adjustment secured by patent motions controlling work table and head.

Built with or without compound table



Built in three different sizes viz: 36″, 48″, and 60″

No deflection in table when drilling in any position on table.

Workmanship and materials of the best.

Gearing throughout machine cut from the solid, the mitre gearing being accurately planed for smooth running at high speeds. Driving Gears of special high carbon, high tensile steel. Bearings, where necessary, gun metal bushed, with ample provisions for efficient oiling.

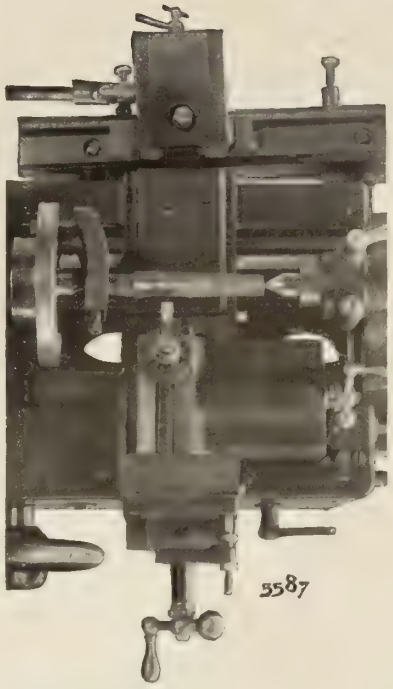
Here is the Way to Solve those "Relieving" Problems

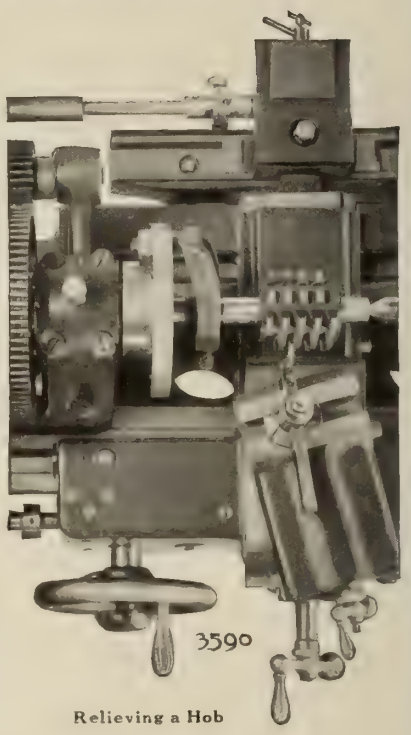


Stepping and Relieving a Taper Reamer

Banish all out-of-date, cumbersome, expensive methods and install

Pratt & Whitney Engine Lathes With Relieving Attachment

A simple, accurate, efficient device which has proved almost universal in its application. Conveniently located, yet out of the operator's way. Can be used in conjunction with the taper attachment on taper work.



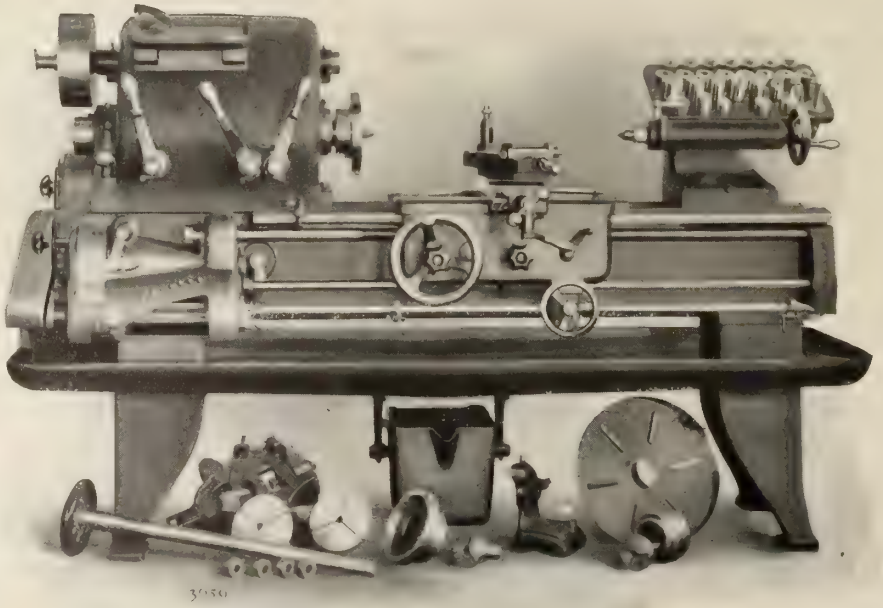
Relieving a Hob

Regular Relieving Attachment

For radial relieving of any description such as Hobs, Cutters, Taps, etc.

Spiral Relieving Attachment

For spiral relieving, works in conjunction with the regular attachment.



Side Relieving Attachment

For side or relieving parallel to the axis. such as on counterbores, sides of cutters, etc. This attachment, while separate, requires the same driving parts and change gears as the regular attachment. (Furnished for the 16-in. lathe only.)

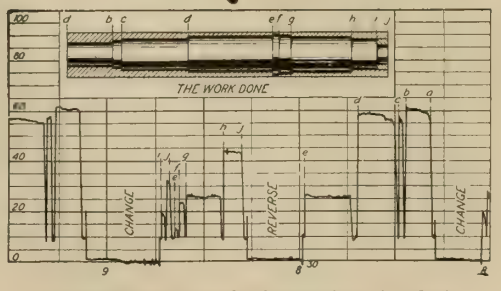
Lathe with Westinghouse Graphic Meter



How the Meter records the turning of a shaft.

Stop Your Losses

Find out your losses in production by using Westinghouse Motors and Controllers and making records with the

Westinghouse Graphic Meter

Study the illustration of the meter record. Note that it shows how long it takes to change and reverse the work. Too much delay in handling work or adjusting tools shows up at once and can be corrected.

Moreover, by means of these records you can determine the most efficient cutting speeds, the best methods for handling materials, and equitable prices for piece work.

It is part of Westinghouse service to show you how to increase your production by means of this equipment. Write our nearest office for full information.

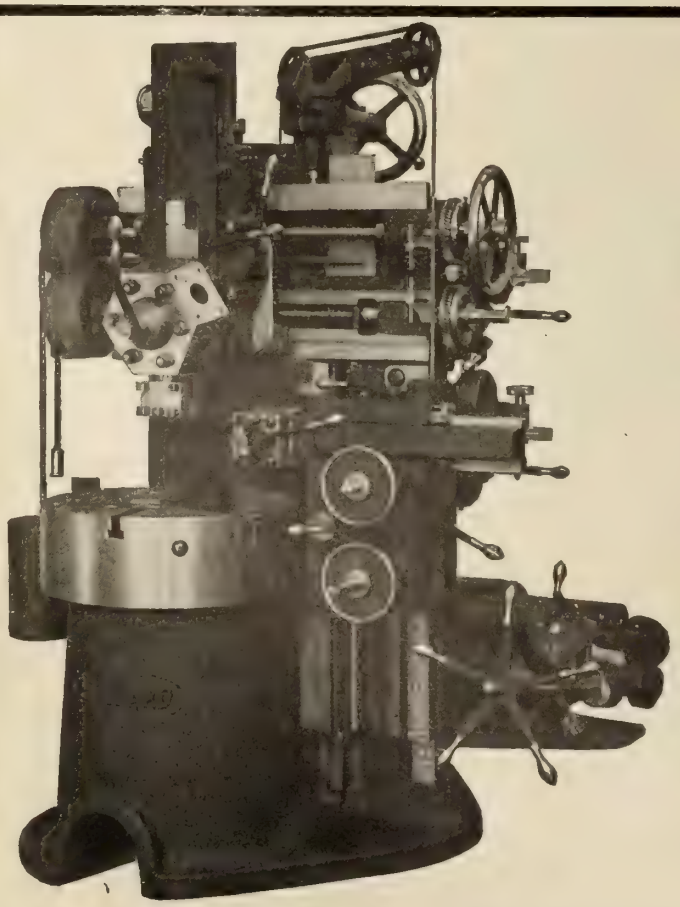
The R. K. LeBlond Machine Tool Co., Cincinnati, Ohio

Canadian Agents—GENERAL SUPPLY CO , Ottawa, Toronto and Winnipeg.



You Pay for the Bullard Vertical Turret Lathe Whether You Buy it or Not

and the longer you wait, the more you pay.

IF YOU ARE NOT USING THIS MACHINE YOU PAY FOR IT, NEVERTHELESS, WITH THE MONEY LOST BY YOUR PRESENT METHODS OF PRODUCTION OF ALL FACE PLATE WORK WITHIN THE RANGE OF THE VERTICAL TURRET LATHE.

This loss is caused principally by wasted time.

The fundamental principle of the Vertical Turret Lathe is the "**elimination of wasted time.**"

Time between cuts is reduced by centralized control of the operation of the whole machine, as well as by rapid power traverse of all parts.

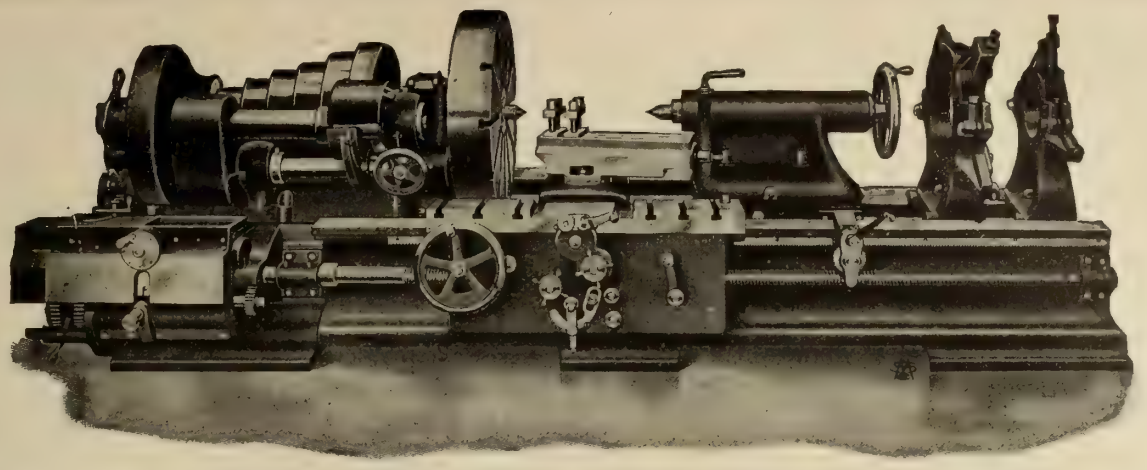
With both a Turret and a Side head, machining of several surfaces at once is possible—**MULTI-CUTTING.** And all the tools needed for a series of operations are held in instant readiness.

In all, every possible moment of the machine's and the operator's time is utilized and made efficient.

Ask for Treatise on Face Plate Work C-15.

THE BULLARD MACHINE TOOL CO.

BRIDGEPORT, CONN., U.S.A.



42-inch TRIPLE GEARED ENGINE LATHE

Instantaneous Change Gear Device, all changes for feeds and screw cutting made without removing a gear and without duplication.
Power Angular Feed to Compound rest of twelve inch travel.
Double Plate Apron prevents all overhang and straining of studs and pinions.
Tail Stock is provided with pawl to engage rack cast in bed.

(Maximum belt pull transmitted to the cutting tool.)

THE BOYE & EMMES MACHINE TOOL COMPANY

Successors to SCHUMACHER & BOYE

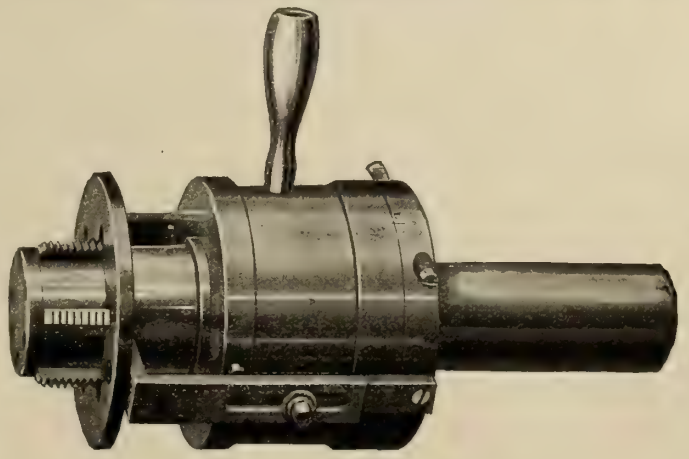
Engine Lathes. **Cincinnati, Ohio, U.S.A.**

Are you trying to do your tapping with solid taps? Why continue to do so?

GEOMETRIC COLLAPSING TAPS

Fitted to your Drill Press or Turret Lathe will do the work in **HALF THE TIME**—and do it **BETTER.** Therefore, the **GEOMETRIC COLLAPSING TAP IS YOUR TOOL.**

While cutting they are as rigid as solid taps, but at the end of the cut they collapse their chasers automatically and are withdrawn without backing out. This gives a perfect thread always.



Will tap either straight or standard pipe thread sizes.

Will tap diameters slightly larger or smaller than the exact size for which the tap is made.

Will permit of advancing the chasers to allow for wear, so that one set of chasers will last much longer than any solid tap, and can be renewed at very small cost, while the tap remains as good as new.
Tell us what your tapping requirements are, and we will quote you a Collapsing Tap that will take care of them.

Garvin Screw Machines

GIVE UNSURPASSED SATISFACTION

The best materials are used in manufacturing these machines. Parts made of Krupp Chrome Nickel Steel, Drop Steel Forgings and Vanadium Steel Springs. Absolutely no steel castings used. Machines can be realigned under all conditions of wear. Spindles are of large diameter, bearings are ground and run in bronze boxes. Cross-slides fitted with plug stops, capable of fine adjustment, and can be lifted from bed without removing turret base. Hexagon Turrets on all machines, except the No. 1. Independent stops to each of the six turret holes. Our turrets and slides have long been renowned for their rigidity without cumbersomeness, the result being large output. The turret momentum is stopped by a solid plug, the lock bolt being used for indexing only. Many other exclusive features.

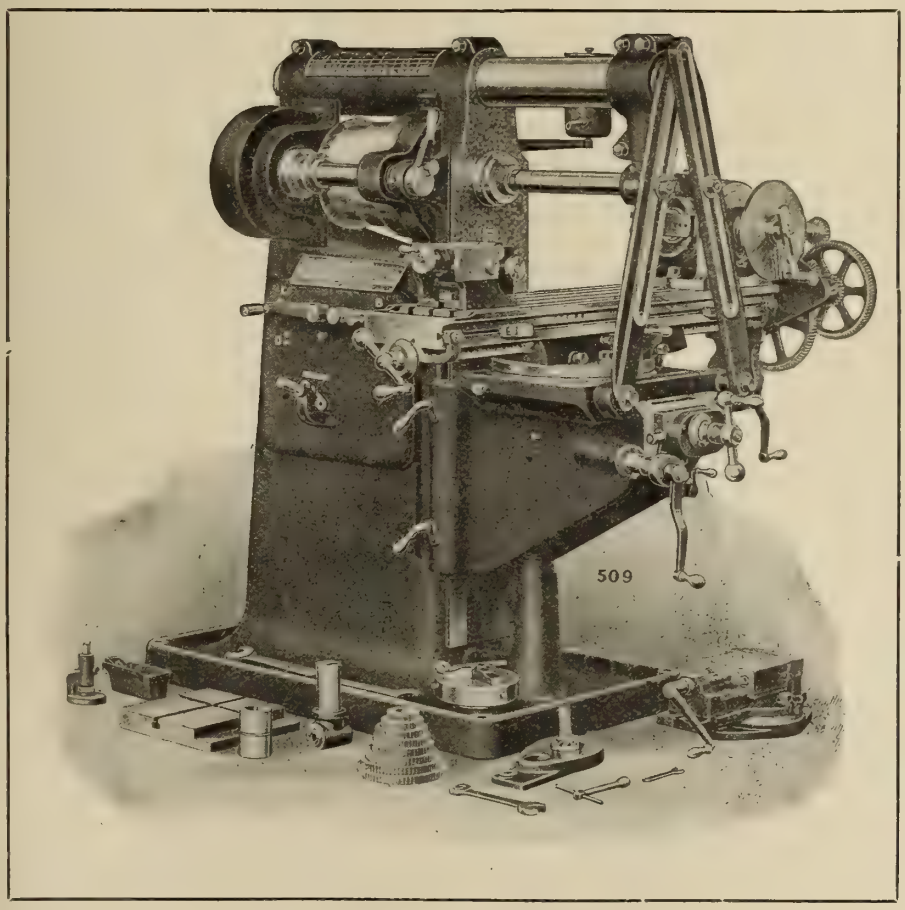
Duplex, Profile and Vertical Spindle Milling Machines: Surface, Hole, Cutter and Tool Grinders: Die Slotters; Screw Machines; Monitor Lathes: Automatic Chucks; Screw Machine and Milling Machine Tools and Attachments; Automatic, Horizontal and Vertical Tapping Machines: Duplex Drill Lathes: Gang Drills: Hand Lathes: Screw Slotting Machines: Spring Coiling Machines: and Special Automobile Machiney, etc.

Cincinnati Cone Driven Millers

IN every shop there is some work on which the cutting is light that can be milled to best advantage on a modern Cone-driven Machine. To meet such requirements we have re-designed our line of Cone Type Millers, Plain and Universal. They have many important features far in advance of other Cone-driven Millers.

The COLUMN is a complete box of rectangular form.

The FEED MECHANISM is a single unit, assembled complete by men who are specialists on this work. When in place, it is an integral part of the machine. It is located high above the floor — the operator need not stoop to reach the levers. The feed changes may be made within the practical limits of milling while taking a cut, without inconvenience or injury to the gears, because they all run at moderate speeds.



The FEED INDEX is direct-reading — no chance for confusion or doubt as to the proper lever movements. It is the simplest index used on any machine tool.

All these features make this type the ideal machine for manufacturing small parts and for tool-room use.

We make a complete line of newly designed Millers;
Plain, Universal, Vertical—Cone-driven, High Power

"Hendey" Centering Machine

Made to meet the demands of those who want a machine that will centre within reasonable limits of accuracy, and amply proportioned in spindle bearings, etc., to withstand wear and tear.

Head and Spindle Construction. The head is rigidly clamped to the bed, giving permanent alignment of spindle. Spindle is large in diameter with ample bearings, front journal being made taper after the well known pattern of the Hendey lathe head. Spindle carries draw-in attachment with watch tool chuck for accurately and conveniently holding combination centre drill and reamer. Thrust taken by ball bearing. Back locking pin working in flange of pulley is provided for use when necessary to remove or replace centre drill.

Jaws of Vise and supporting block are hardened and ground.

Alignment of Spindle with Jaws. Jaws are aligned from spindle by proof bar carried in spindle. This care in alignment is exercised in order to enable machine to accurately centre stock for finishing purposes after coming from turret lathe or screw machine.

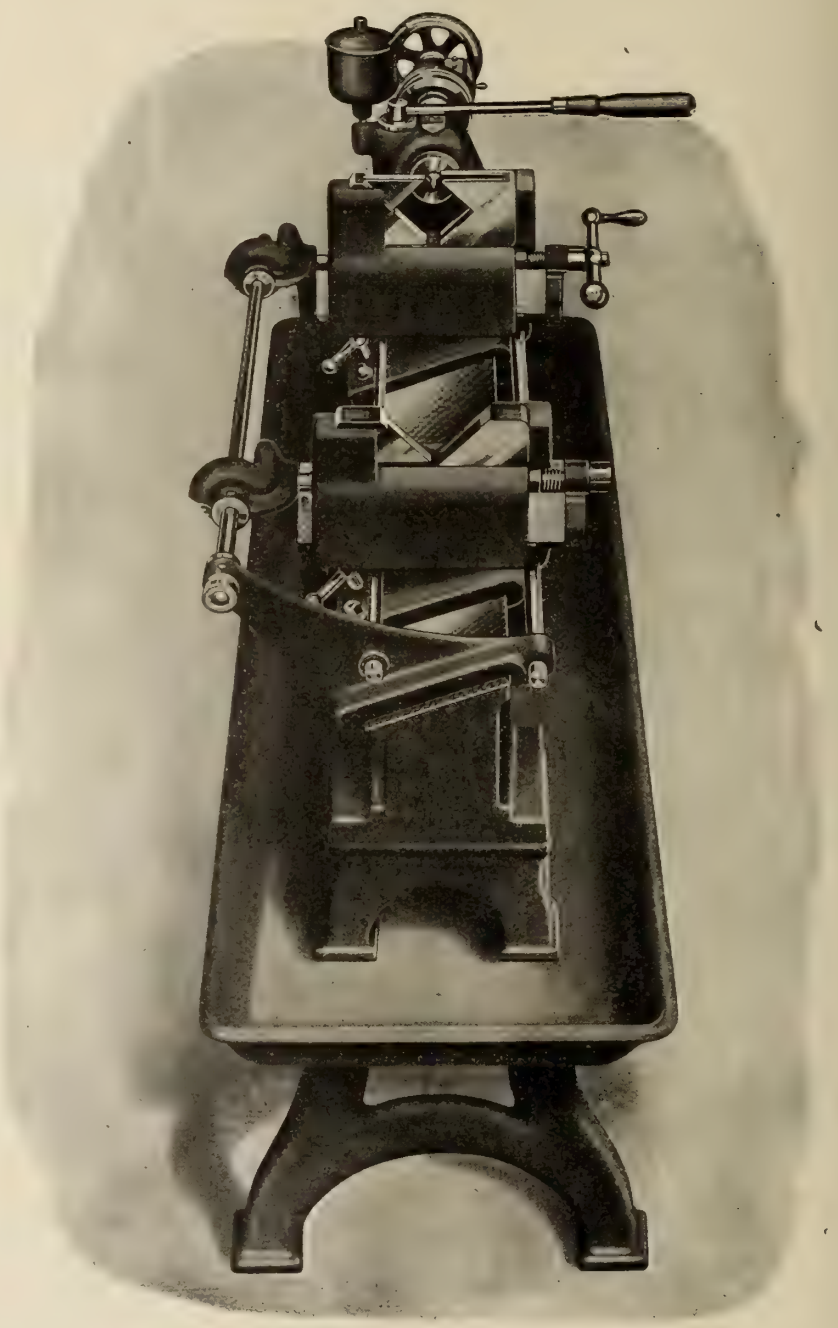
Relative Movement of Vise and Block is maintained by means of the connecting rod and spur geared drive at back of machine, controlled from the one ball handle at front of vise. This means that, no matter what the diameter of the bar may be within the limits of the machine, it will **always be supported in a horizontal position,** there being no hand adjustment and "eye-alignment" necessary for back support.

Inclined Surface of Bed, sloping away from operator, tends to direct the chips into the pan, rather than have them accumulate around the head, necessitating frequent cleanings when it is desired to shift vise carriage.

Saddles are gibbed and fitted to bed, and provided with binding handles for ready clamping in position.

Heavy Parallel Bars, running the length of machine, serve the two-fold purpose of a rack for carrying stock to be centered, and, in connection with the inclined bed, prevent it from being bruised and banged through common use of bed as temporary support for the stock.

Capacity of Machine is from 5-16 to 4 inches, inclusive.



The Hendey Machine Company, TORRINGTON, CONN.

The Heart
Of a Polishing Lathe is--

Its Bearings

The bearings are the most important part of a polishing lathe. Our No. 3 is equipped with the best standard make of ball bearings. These bearings are completely protected from dust or grit by special end CASES. They are lubricated with light grease and require no additional lubricating more often than from three to six months. With our design and construction all jar and vibration is eliminated, the wheels running smoothly and in perfect balance.

We make our No. 3 with three different types of spindle pulleys: The illustration above shows the plain pulley; a stepped spindle pulley or tight and loose pulleys can be furnished. With the latter type the loose pulley is fitted with ball bearings. This machine can be driven from below. Either a plain or ball bearing countershaft can be furnished. Dust hoods and exhaust fan can also be supplied, in which case the exhaust fan is driven from pulley on the countershaft.

Saving in power and upkeep, and better and more work are guaranteed in our No. 3 Ball Bearing Polishing Lathes.

BELOIT **WISCONSIN**

Detroit Twist Drills

Trade Mark

like the fame of a Toledo blade

—stands this other master product of the finest steel.

The swordmakers of Toledo, Spain, became world-famous for the *quality* of their product.

This was recognized everywhere.

"Toledo Steel" became the synonym for the *finest* steel.

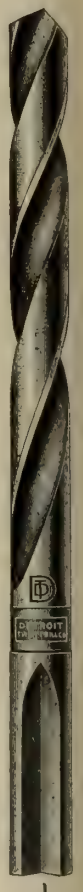
Its value was *forged and tempered into it.* The men who did this, did nothing else.

They were swordmakers—for a lifetime. They *knew* steel.

And here lay their *secret.*

Each generation of these Spanish workmen passed its specialized knowledge and experience on to the next. Thus by year after year of concentration, they developed the super-quality of the "Toledo" blade. Thus their reputation was earned.

Just so to-day has this other supreme steel tool become known.



"Detroit Twist Drills"

—are recognized everywhere by the quality that is unerringly *built* into them.

There are men making "Detroit" Drills to-day who themselves have been *concentrating* on this for over a quarter century. Like a Toledo blade—"Detroit Twist Drills" are known to be the master workmen's master product.

Tests prove this.

As the skilled swordmaker tested each blade by bending, striking and finally plunging it through a $\frac{1}{8}''$ sheet of steel, so these skilled drillmakers test Detroit Drills by every practical *drill* test. Not only is the raw steel kept constant by *chemical analysis* and each step in the making proved by *rigid inspection*—but the final drilling power is made subject to *your own* tests!

Try a Detroit Drill on the toughest job in your shop and you will see why they are so justly famed.

Write to-day for "Catalogue R"

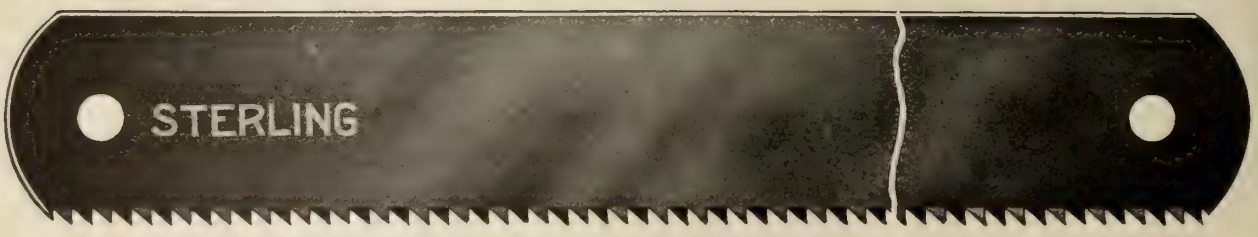
"STERLING" HACK SAWS



"Sterling" Hack Saw Blades

The old reliable, but always up-to-date, never follow, always lead. You have used them for years, if not, it's not too late to get the best. Don't accept substitutes because they can be bought at a lower price. "STERLING" is not among the cheap lines but in a class by itself.

"STERLING" High Speed Power Hack Saw Machines

This machine is the product of up-to-date methods, displacing the old, slow-running saw, with from two to three times the capacity of other machines in the market.

For cutting material from two to eight inches in diameter, it is the most economical metal-cutting machine in use.

MANUFACTURED BY

Diamond Saw & Stamping Works

BUFFALO, N.Y., U.S.A.

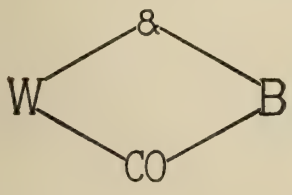
Handled by first class Jobbers

Buy "Hercules"

And You'll Buy Fewer Drills

ALTHOUGH we have facilities for turning out **"Hercules"** High Speed Twist Drills in unlimited quantities, not an ounce of defective material or a shade of variation in quality gets past our final examining and testing department.

¶ Every **"Hercules"** Drill is made to uphold an efficiency standard that has made and held customers for 58 years. We are so sure of every **"Hercules"** drill that we never request the privilege of supplying "specials" for competitive tests—if you must test, test any **"Hercules"** from your jobber's stock.



Tools Of Quality Bear These Marks

Twisting While Hot Leaves The Backbone

¶ **Hercules** High Speed Twist Drills are made from High Percentage Vanadium High Speed Steel by the only **"twisted-while-hot-process"** that retains all the strength of the steel in the finished drill. The backbone is all there because the grain of the steel is undisturbed, insuring longer edge-holding and greater resistance to the strains of metals having different degrees of hardness.

¶ We invite you to set your own standards for quality and try our **"Hercules"** Drills.

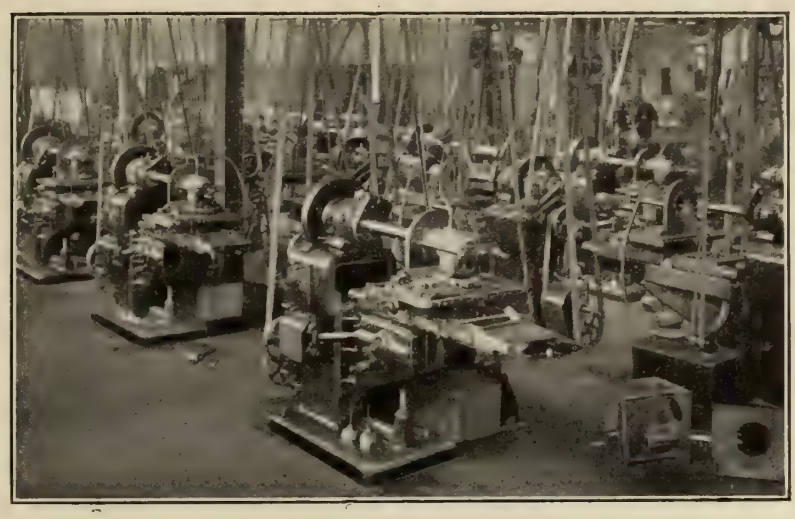
167 Heald Grinding Machines In Eight Plants



A View in the Ferro Shop.

That's Real Proof; The Kind The Buyer Wants

BECAUSE *facts* speak louder than *claims*. Because when a firm buys one machine, and then another and another and another, you *know* that the machine must actually have "made good." Claims may sell one machine, but how about the others?

Note this brief list taken from the many "big" Heald users:

NAME	LOCATION	NO. HEALD GRINDING MACHINES USED
Hyatt Roller Bearing Co.	Newark, N.J.	41
Ferro Mch. & Fdry Co.	Cleveland, O.	26
Cadillac Motor Car Co.	Detroit, Mich.	21
Continental Motor Co.	Muskegon & Detroit, Mich.	21
Morrow Mfg. Co.	Elmira, N.Y.	19
Packard Motor Car Co.	Detroit, Mich.	18
Buick Motor Co.	Flint, Mich.	11
Brown-Lipe-Chapin Co.	Syracuse, N.Y.	10
	Total	167

Be sure to send for our new book "Practical Hints on Internal Grinding." It gives full details on the "Heald" plus many interesting grinding pointers—worth knowing.

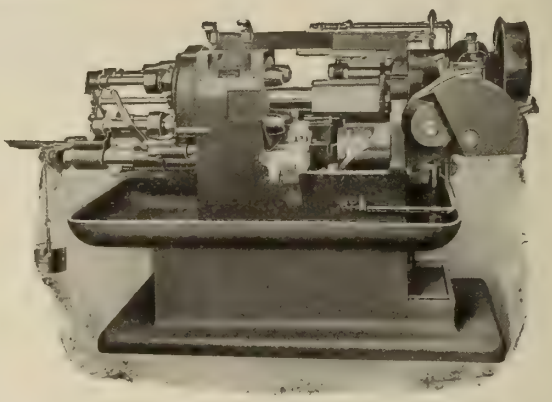
Cincinnati Milwaukee
London, Eng.

CARBORUNDUM NIAGARA FALLS

Gridley Automatic Turret Lathe

For Rapid, Convenient and Economical Service



"GRIDLEY" Multiple Spindle

The "Gridley" Differs

from all other automatics in the manner of supporting tools, and in the arrangement of the holders on the tool slides of the turret.

On all other automatics there is an overhang of the tool. This overhang prevents the performance of accurate work, because the method of supporting tools does not permit as heavy cuts or as coarse feeds.

The "Gridley" Saves Money

as *one operator can attend to from three to six machines at once,* and can use tools tandem when rapid production is necessary.

Handles Work of Greater Length and of More Complex Character Than Any Other Automatic

We manufacture both *multiple Spindle* and *Single Spindle Automatics.* A post card will bring *our illustrated catalog and full particulars* by return mail. *Write us NOW lest you forget.*

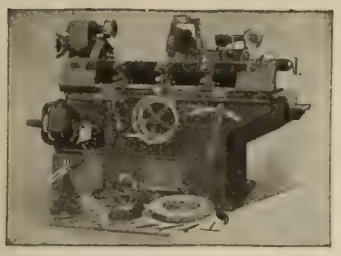
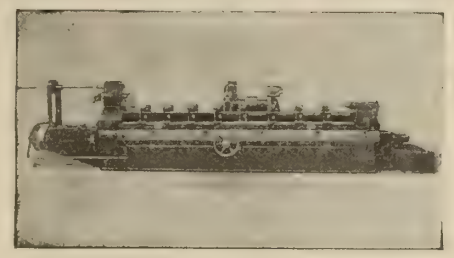
LANDIS PRECISION GRINDING MACHINES



Landis Plain Grinding Machines.

10″ x 30″, 12 x 32″, 12″ x 42″, 12″ x 66″, 12″ x 96″, 12″ x 120″, 16″ x 72″, 20″ x 96″, 20″ x 120″, 20″ x 144″, 20″ x 168″. These machines are intended for finishing straight and taper spindles, shafts, rolls, tubing and all other work within their range which can be revolved on dead centres.



Large Type.

Standard sizes: 20″ x 96″, 20″ x 120″, 20″ x 141″, 20″ x 168″.

These manufacturing machines are adapted for straight and taper cylindrical shafts, spindles, pistons, corliss valves, plungers, tubing, and are especially desirable for grinding hardened steel and iron rolls.

Plain Grinding Machine with Gap.

These are our 16″ Plain Machines built with gap in the bed to suit the location of the projection on the work.

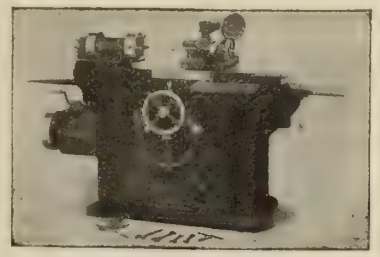
Largest exclusive manufacturers of grinding machines in the world.

Landis Universal Machines (Large Type).

No. 1 (10″ x 20″), No. 1½ (10″ x 30″), No. 2 (12″ x 32″), No. 3 (12″ x 42″), No. 4 (12″ x 66″).

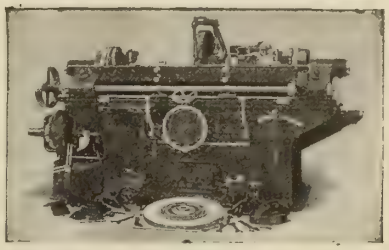
Nos. 2, 3, 4 (also built with 16″ swing) are used for finishing tools and a variety of straight or taper parts (both external and internal) as are common to the toolroom, machine shop, railroad shop, etc.

Attachments such as magnetic chuck, gear cutter attachments, cam grinding attachment, side mill grinding attachment, etc., can be used on these machines.



Landis Internal Grinding Machines.

This machine is intended for straight and taper internal grinding. The fixtures for these machines will grind holes ¼″ diameter or larger, and up to 12″ long.



Landis Crank Grinding Machines.

These machines are designed for grinding single or multiple throw crank shafts used in gas and small steam engines.

Design Your Work To Be Besly Ground

Designers who are up on disc grinding practice call for "Besly Grinder Finish" on their drawings, and often are able to make slight changes in design of surfaces so as to bring the work within the capacity of Besly Grinders, thereby making wonderful reductions in manufacturing costs. When a surface is broken by indentations into which the grindings discharge, larger work can be ground than where surface is unbroken, because, owing to the smaller area, travel of grindings is reduced, less stock is removed and less feeding pressure and power is required. (Extract from Besly's Modern Disc Grinding Practice.)

Scale 1½″ = 12″

Examples of work designed with recessed surfaces to be finished from the rough on the Besly Grinder.

Ask for 1912 Edition of Besly's Modern Disc Grinding Practice. It's free and will show the way to *reduced costs* and *increased profits* on your flat surfacing.

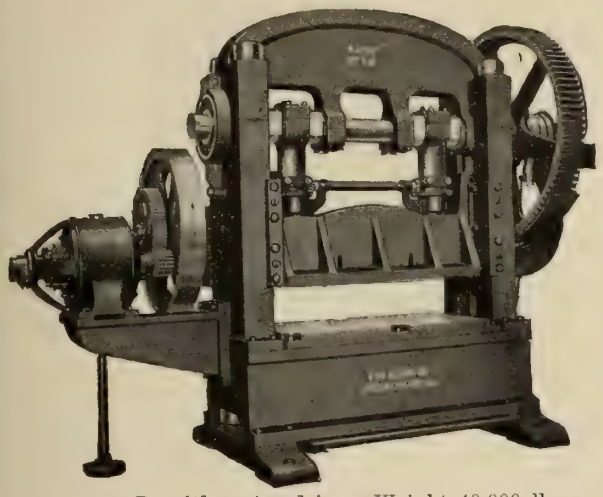
Universal Reversible Jaw Chuck

Bliss Double and Triple Crank Presses

combine a massive, powerful construction with every facility for delicate adjustment



No. 7D, with motor drive. Weight 40,000 lbs.

They are fitted with Pin, Jaw or Friction Clutches, and arranged for either belt or direct motor drive. They have correct proportions, extra heavy shafts and well gibbed slides. The Pitmans are connected so as to be always adjusted simultaneously, insuring perfect alignment between the face of the slide and the bed at all times.

Built in over 150 sizes and styles with straight side or overhanging frames. They are used in the manufacture of sheet metal goods, such as vapor stoves, wrought-iron ranges, agricultural implements, paneled ceilings, metal furniture, doors, sashes, window frames, single drip pans, armature disc cutting, also for operating gang punch dies. They are also arranged for forging purposes in making hoes, hammers, mattocks and similar work. State requirements and ask for details.

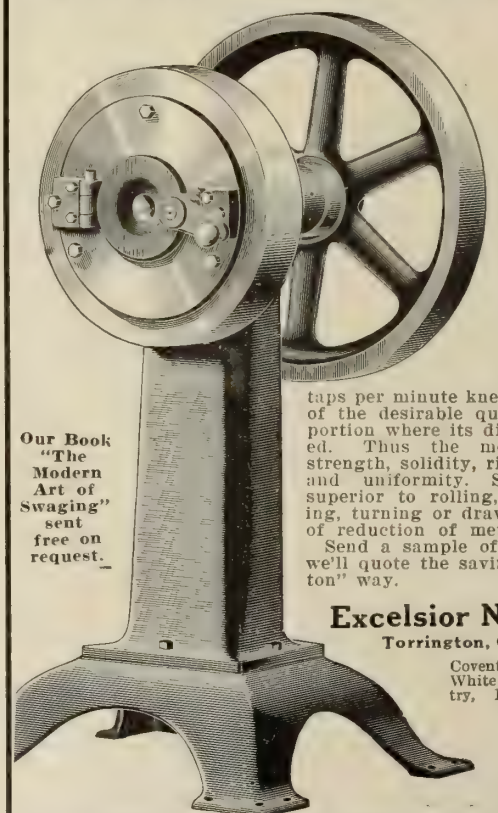
REDUCE METAL
WITHOUT WEAKENING IT



Swage The Dayton Way

The Dayton Swaging Machine does not sacrifice one particle of strength of the metal being reduced. From 2,000 to 6,000 taps per minute knead or squeeze all of the desirable quantities into the portion where its diameter is reduced. Thus the metal has added strength, solidity, rigidity, elasticity and uniformity. Swaging is far superior to rolling, grinding, milling, turning or drawing as a means of reduction of metal.

Send a sample of your work and we'll quote the saving by the "Layton" way.

Our Book "The Modern Art of Swaging" sent free on request.

DODGE THE PESSIMIST!

¶ A pessimist is a man who cannot see the good in anything. He is short-sighted, grouchy and usually wants to be left alone.

¶ Leave him alone.

¶ A man who cannot see good in ADVERTISING is a pessimist. He is out of alignment. He is out of focus.

¶ Leave him alone. Ostracize him. It's his only hope.

¶ Beware of the man who does not advertise and of unadvertised goods.

¶ The printed word costs money and is permanent. It is everlasting evidence which cannot be disclaimed or disputed. Because of this it tells the truth. It may be attractive, but nevertheless the truth.

¶ Favor the salesman of an advertised house. He has back of him a liberal policy which is invariably reflected in his goods and in the service of the firm he works for.

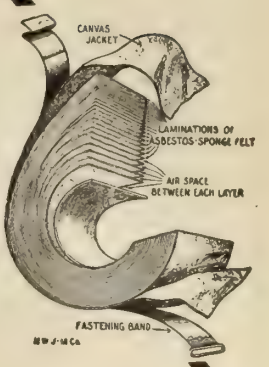
¶ Read the advertising pages of "Canadian Machinery," and get to know the firms who advertise. They are the people it will pay you to do business with when you purchase machinery for your plant. Advertising is their way—the modern way—of telling you that they are reliable, up-to-date, and in every way, good people to do business with. Furthermore it stamps them as optimists.

¶ Dodge the pessimist. He doesn't want your trade, anyway.

¶ If he does, why doesn't he say so?

CANADIAN MACHINERY
AND MANUFACTURING NEWS
143 University Avenue
TORONTO

Won't Crack, Break, or Lose Its Insulating Value from Vibration or Rough Usage



The temperature of high pressure pipes soon dries out moulded and ordinary pipe coverings. Then expansion and contraction of the pipes and vibration reduce the carbonate of lime (chalk) and other like materials with which these coverings are filled to a powder. This powder settles at the bottom of the canvas covering, leaving the top insufficiently covered, and gradually sifts through the canvas. Thus what little insulating properties they originally had are quickly lost.

J-M Asbesto-Sponge Felted Pipe Covering

retains its high insulating properties indefinitely. Pipes covered with it can even be walked on without injury. This is because it is made of many layers of fine paper, composed of pure long-fibred Asbestos and a small quantity of granulated sponge. It has been found in perfect condition after more than fifteen years' service on underground pipes. ¶ Can be taken off pipes and replaced without injury. This is an important feature around manufacturing plants where changes are continually occurring.

Ask nearest Branch for Sample and Catalogue No. 100.

INTERNATIONAL MARINE SIGNAL COMPANY, LIMITED

OTTAWA, ONTARIO

EVERYWHERE

If you were in some far off land and needed babbitt metal would it not be a comfort to you, if not actual pleasure, to find "good old reliable Magnolia Metal"?

What a history could be written of its wanderings over the seven seas by ships, up the Andes on Llamas, to the mines in Mexico by Burros, to the teak forests of Siam on Elephants; trekking over the sands of Africa by Ox Carts, or across the steppes of Siberia on sleds.

Engineers and Mechanics cannot take chances in these out of the way places with their babbitts; they must have the best, and therefore specify Magnolia.

They know that Magnolia is always uniform and reliable, that it is suitable for highest speeds or heaviest pressures, and can also be used for piston packing, bull rings, etc., etc.

Tamsos Mine, Tarkwa, Via Sekondi, West Africa.

Magnolia Metal Company, New York City.

Dear Sirs:—

As a user of "Magnolia Metal" for some years—in all parts of the world—and under some rotten conditions, I have pleasure in forwarding 50 cents for one of your Engineer's Pocket Books, knowing full well that anything coming from the home of Magnolia Metal will be good.

I am at present using Magnolia Metal throughout this plant. We get it through our London Purchasing Agent, and it is dandy stuff, too.

Wishing you every success with your good goods, permit me to remain,

Yours very truly,

K. R. MOURE, Chief Engineer.

SPECIAL OFFER:

PRACTICAL ENGINEER POCKET BOOK: 680 pages, over 2000 subjects. Price 40c. post paid. We do not aim to make a profit on these books. We buy them in large quantities as an advertising medium and give Engineers the benefit of low price. They are highly spoken of by Engineers.

Address Montreal Office.

Sold by leading dealers everywhere or by

Magnolia Metal Co.

225 St. Ambroise St., Montreal

The "KEYSTONE"

PORTABLE LAMP GUARD
Is Made For "HEAVY DUTY"

There's nothing flimsy or breakable about the KEYSTONE. It's a sturdy, serviceable guard, with malleable iron castings, bessemer steel ribs solidly locked together, and a man's-size, kiln-dried maple handle.

The socket is sunk, and can be quickly removed to make connections *inside the handle,* where there is room to knot the cord so as to take all the strain and prevent loosening the connections and short circuiting.

The malleable hook will bear a man's weight, so that he can support himself where necessary and hold the light with the one hand, or use the hook to reach and lift heavy parts.

Made in 16 c.p. and 32 c.p. sizes. Insulation perfect up to 600 volts.

The Joint—

—it's a vital part, a part you should know *all* about before accepting or rejecting any chain.

MORSE Silent Chains have a joint totally different from all other chains. For twenty years this two-pin "rocker joint," in all kinds of service and under all kinds of conditions, has proved vastly superior to all other joints.

The rocking action of the two pins, one against the other, eliminates turning friction and reduces wear to a minimum. That means smaller repair and maintenance costs.

All Morse Silent Chains have this "rocker joint" whether for ¼ H. P. or 3,000 H. P., for high speed or low speed. Special machinery for making large sizes insures prompt shipment. Small sizes can be shipped almost immediately. Write us for particulars and Bulletin No. 11.

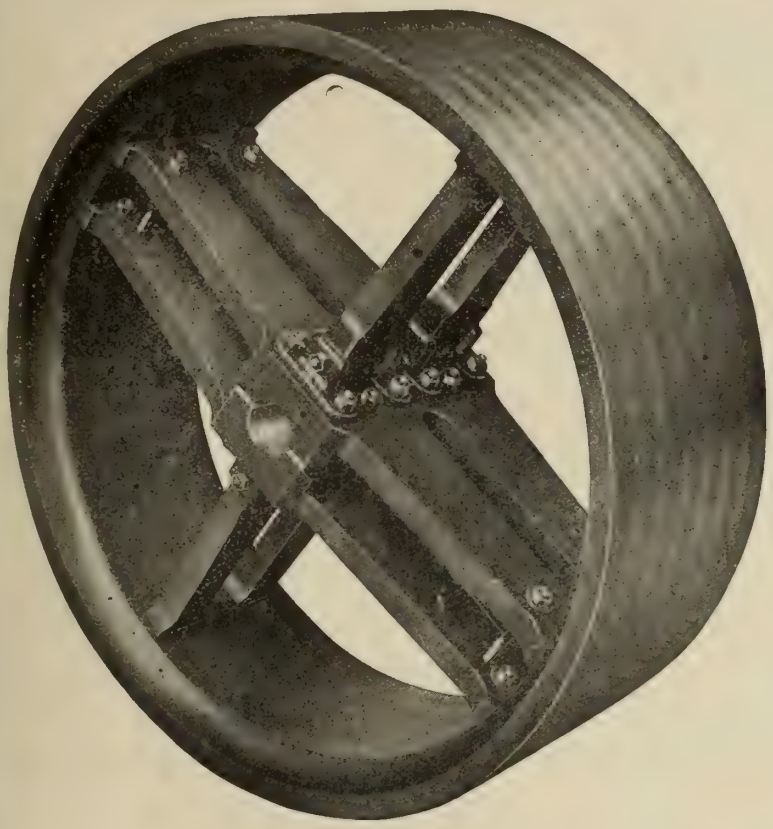
Pulleys That Pull



In your factory equipment every unit should **pull** steadily, constantly, surely and together. Let one unit be defective, slipshod, out of order, and your whole plant is affected. No one factor in your factory counts for more than the whirling Pulley. It is the muscle of your power plant. It is all important. Let it break and your engine is useless, your men are idle, your machines are no longer money-makers. There is one **Sure** way to prevent Pulley Troubles — that way is to use

DODGE PULLEYS

In pulleys, as in all other things, there is one that is pre-eminently the Best. The DODGE line of Pulleys are the best—not because we say so, but because we make them so. We specialize on Pulleys. One of the largest factories in Canada does nothing but make Dodge Pulleys and Dodge Transmission Machinery. Quality has created a tremendous demand—the demand a huge output — the output enables us to give you quality at a satisfactory price.

When you are in the market for one Pulley or a Hundred, specify Dodge. We give a bonus of absolute satisfaction with every Pulley—Wood or Iron—or any other piece of Dodge Transmission Machinery you may buy. Insist on the genuine Dodge—**THE BEST**.

You Need a Machine Like This on a Dozen Different Jobs

It's a No. 2 Knight Milling and Drilling Machine

This machine is very rigid, powerful and accurate, so that close work may be turned out with a high degree of satisfaction, and in the shortest possible time. The adjustments are quickly and easily made. On a large variety of work it is possible to make a saving of from 20 to 50 per cent. in time, as compared with other machines.

The fact that hundreds of Knight Machines are now in use in this and foreign countries proves that they are not experiments. These machines are made in three sizes.

Briefly, the construction of the No. 2 Knight Miller is as follows:—Spindle of crucible steel, ground bearings; working surface of table, 29 x 8½ inches; feed, longitudinal and transverse; floor space, 60x68 inches; weight, crated for shipment, about 2,500 lbs.

Reciprocating Straight-Blade Sawing Machines

By Charles Wicksteed

The writer of this article traces the history and development of Straight-Blade Sawing Machines, and, in addition to showing the extent of their useful and economical production application, indicates the direction in which further improvement is necessary, and sure to proceed.

THE saw is one of the earliest tools known to have been used, and is in fact the earliest tool that has been traced in Egyptian history. It was first found in the form of a notched bronze knife (A), Fig. 1. in the 3rd Dynasty, or about 5,000 years B. C. It was followed by larger toothed saws in the 4th to 6th Dynasties, which were used by carpenters; but there are no dated specimens until the seventh century B. C., when the Assyrians used iron saws, as shown at (B). The first knives on record were made out of flint, and were in fact saws with minute teeth (C). They must have been used for cutting up animals, as the teeth would break away even on soft wood. Rasps, which are but a form of saw, were first made of sheets of bronze punched and coiled round, as shown in (D), but the Assyrians in the seventh century used the straight rasp made of iron exactly like the modern type (E).

Coming down to modern times, the saw is possibly more used than any other tool. It has taken three distinct forms, both for the working of wood and metal; the straight saw, which is simply a development of the first toothed knife, the band saw and the circular saw.

Hack Sawing Machines.

The author proposes in this Paper to discuss the merits of the Straight-Blade Reciprocating Saw for metal work, and to point out that, although great pains have been taken to bring to perfection the Band and Circular type, curiously enough the Straight-Blade Reciprocating Sawing-Machine has been, comparatively speaking, neglected. The simple fact that, with few exceptions, the cost of Hack Sawing-Machines has in former years been only from $25 to $50 against a much higher cost for other types, fully attests the truth of this statement. Primitive blades sold at about 6 cents each and primitive machines sold for a few dollars were good enough for this system. The author thinks that it was the Millers Fall Co., Mass., who first brought out the hack sawing-machine, known as the "Star," Fig. 2.

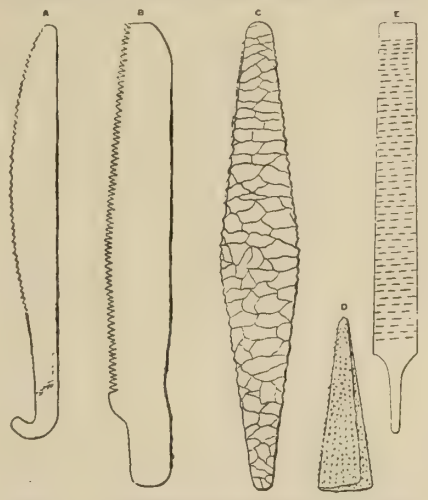

FIG. 1. ANCIENT EGYPTIAN TOOLS.
A—Notched bronze knife. 3rd Dynasty, 5,000 B.C.
B—Assyrian iron. 7th Century, B.C.
C—Flint knife.
D—Rasp made of bronze, punched and coiled round.
E—Straight rasp, iron, Assyrian. 7th Century.

This is the crudest and lightest possible device for working a saw backwards and forwards by power instead of by hand. It is not curious that a start should be made in this way, but the curious part is that this machine, in all its essentials and with all its faults, prevails up to the present time. The connecting-rod was made of wood, the old hand-saw bow has been maintained intact, and the guides were of the most elementary character

The next Hack Sawing-Machine introduced, was, the author believes, the style known as the "Simplex," Fig. 3. This is more elaborate and heavier, the old hack saw-frame giving way to something stronger. It was brought out by Mr. Hoefer and proved very successful. These two machines were the forerunners of all the present hack sawing-machines.

Another very early pattern of hack sawing-machine was the "Eureka," Fig. 4, which was made by Messrs. G. Thompson, Son and Co., of New Haven, Conn. This is a far more mechanical and carefully designed structure; it has a solid base, and a real attempt was made to guide the saw straight. The thrust is in direct line, and the upper guide capable of extension, so as to admit the large variation in length of blade being used. This was a magazine saw, a long blade like the band saw being coiled up and brought out for use as the working part became worn up. The coil contained 25 feet.

One of the latest machines brought out is the "Milford," Fig. 5. This is a carefully designed tool, and is in great demand. It is fitted with a quick return and a clutch device for lifting the blade free of the work on the idle or return stroke. It has a geared drive of 4 to 1, and an automatic stop. In the author's opinion, these four designs fairly illustrate the progress of the original type of hack sawing-machine up to a recent date, although many others might be mentioned, for instance, the "Racine," which is a compact and strong tool, and the "Marvel," a strong, complicated machine with a positive feed.

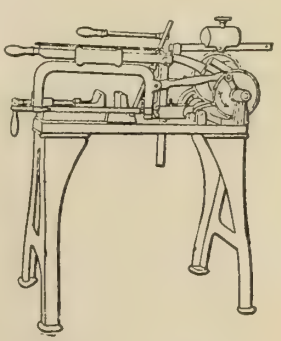

Fig. 5. Milford.

Steps Towards Larger Capacity.

Messrs. Herberts, of Manchester, were one of the first firms who seriously took the matter in hand, with the view to making altogether stronger machines for doing the work quicker and taking larger sections. They made saws

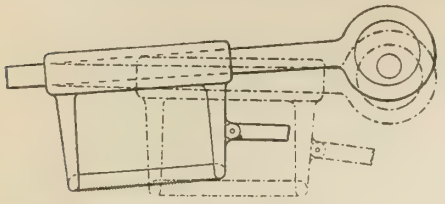

FIG. 6. ECCENTRIC MOTION FOR TILTING THE SAW.

of a capacity hitherto commercially unknown, the largest being capable of taking 18 by 30 inches. They also introduced, amongst other things, an automatic feed for the work, but the most important feature of their machines was the eccentric motion given to the fulcrum of the saw frame, shown in Fig. 6, where, every twenty strokes or so, the eccentric on which the fulcrum of the frame is pivoted moved around slightly thus putting the saw at a different angle to its work and bringing it on a very obtuse corner. By this means it was always working on a comparatively small surface, and it thus became much easier to saw heavy sections. The author believes that Messrs. Herberts were able to cut bars much quicker than formerly. For in-

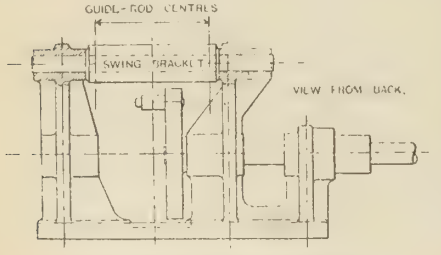

FIG. 7. FRAME BEARING.

stance, a 4-inch bar could be cut in 20 minutes, compared with an hour taken by most previous machines. The only disadvantage in this method is, in the author's opinion, that when first the eccentric is moved, the effect on the saw is rather rough, but as quick work is often of greater importance than too great economy in saw-blades, the merits of the machine were rapidly appreciated. The author thinks that this firm was the first to use a stronger and better blade, and they were backed up by the Stirling Co., who used tungsten-steel. Messrs. Herberts have recently constructed a tool in which the blade is set at an angle to the guides. This causes further pressure on the blade while cutting, and takes the place of the weight to that extent.

Messrs. Holroyd and Co., of Milnrow, also introduced an excellent machine for rapid work with the same object in view as Messrs. Herberts had, the difference being, that, in the case of the Holroyd machine, the bar turned round a little every stroke, thus presenting a small surface to the saw, as Messrs. Herberts did with their eccentric motion. The advantage of the Holroyd system was, that, since the bar was continually turning round, it was difficult for the saw to run, and the work would be approximately as true as that produced in a cutting-off lathe.

Advantages.

(1)—The comparatively low cost of the machine and blade, and the fact that the blade can be made any temper to suit the work.

(2)—In comparison with the Circular Saw, it will cut any depth that the

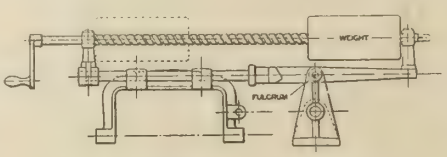

FIG. 8. MOVEABLE WEIGHT TO PREVENT VIBRATION.

frame, which holds it, will admit. Extra depth does not necessitate extra cost of blades, and it will cut any length within 6 inches of the length of the blade. A circular saw, taking the boss into consideration, will not make a cut much deeper than one-third of its diameter, and for every extra inch in depth the saw must be increased 2 and 3 inches in diameter. It is a most expensive and cumbrous tool, necessarily fairly thick and exceeedingly difficult, being nearly impossible to get quite hard, and, if made quite hard, is of course liable to break up.

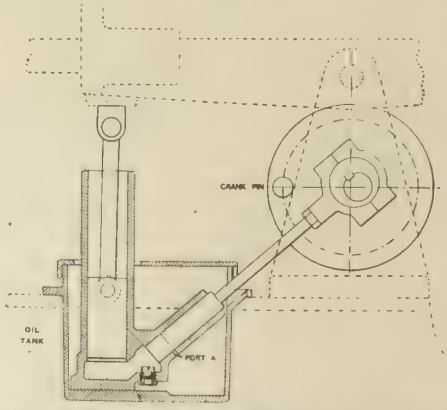

FIG. 9. PUMP AND RAM TO LIFT AND LOWER SAW.

(3)—In many cases the Band Saw must be cut in order to be threaded through the work, and, like the Circular Saw, is almost impossible to be got quite hard; moreover, it is dangerous to use if hard.

(4)—Another advantage of the straight blade over the circular saw or lathe cutting-off machine, is the narrowness of the cut, say 1-16 inch instead of ¼ inch. This, so far as the circular saw is concerned, at any rate

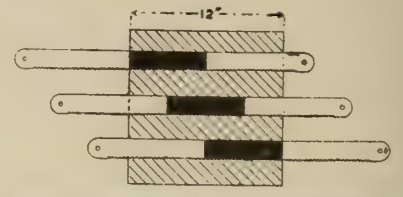

FIG. 10. THREE SAW POSITIONS.
Showing a saw of 6 in. stroke, cutting through a 12 in. block. The black portion is that which always remains in the saw cut.

reduces the power taken in exact proportion to the width to be cut, and in both cases it usually saves material enough to pay for the whole operation. That is to say, if the material saved by the narrow cut as against the wide one is taken into account at the end of the day, sufficient material will have been saved to pay for the whole cost of cutting including establishment expenses.

(5)—The power taken is about one-fourth of that taken by a circular saw. One unit will cut 80 superficial square inches, which is equivalent to eleven bars of 3 inches diameter or three heavy section girders, 20 inches by 7½ inches.

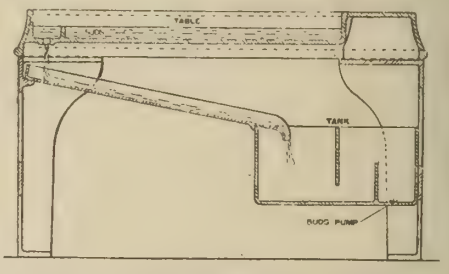

FIG. 11. PUMP AND TANK BELOW MACHINE.

Principles of Construction.

When once convinced that the straight-blade reciprocating machine had great theoretical advantages over its competitors, the Circular Saw and the Band Saw, it did not take very long to discover the principles on which it must be made:—

(1)—The blade must be kept absolutely firm and perfectly square with the work.

(2)—It must be strong enough to stand all the weight that the teeth will take without breaking.

(3)—The blade must be made of the highest possible quality of steel with the best cutting edge that is practicable.

(4)—The machine must be well designed and work the blade without spring or vibration.

(5)—Since the pressure on the blade must be considerable, an absolutely reliable release on the return stroke must be provided. In connection with this, the author has found from experiments that, unless the weight was heavy, it made little or no difference whether the blade was released on the return stroke or not, but with a very heavy weight the blade would be quickly destroyed.

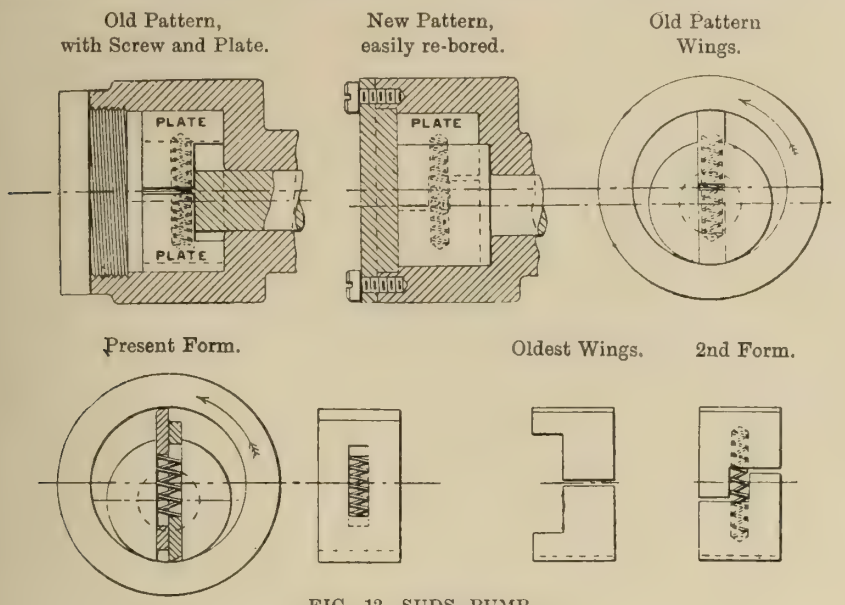

FIG. 12. SUDS PUMP.

Established Features.

Taking the points just mentioned seriatim, the blades have not been brought to the high quality now described without much trouble on the part of the makers, who have been kind enough to assist the author in this respect. The points which appear to be fairly established are:—

(1)—For ordinary work, the coarse-pitch tooth, not less than 10 to the inch, is the best. They cut better, they clear themselves better, and there is better opportunity to give side clearance, which is specially necessary in the deep blades necessary for heavy machines.

(2)—To make the blade strong enough to take the weight that the teeth will stand, it is not necessary to do any special tempering for this purpose. If the temper is right for the teeth, it is right for the back of the blade.

(3)—Extra strength must be obtained, not by extra thickness but by extra depth. Extra thickness does not help in any way. If the blade is 20 per cent. extra thick it requires exactly 20 per cent. more weight put on to get through the work in the same time. Theoretically, the thinner the blade the better, but in practice the deep blades must be made thicker for convenience of manufacture, because makers find it too difficult to harden deep thin blades absolutely straight, and it is evident that the deeper the blade the more difficult it is to keep the clearance. The blades used by the author vary from ¾ inch to 2 inches in depth and from 19 to 16 wire-gauge thick.

(4)—The greatest weight that a tooth will take without injury must be ascertained, and the blade must then be made strong enough to take it. This weight the author finds at present to be about 7 lb. per tooth or 70 lb. per inch. A weight of 210 lb. is therefore put on a 6-inch machine, which enables it to use practically the full capacity of the blade up to a 4-inch bar. As the machine gets larger, the proportion of weight is increased. Thus in a 15-inch machine, 700 lb. is put on, so that the machine will use the full capacity of the blade when sawing a 10-inch surface. The proportion is increased in this way because it is presumed that the 6-inch machine, for instance, will principally be doing smaller work, and that the larger machines are intended for large work which it is important to get through as quickly as possible.

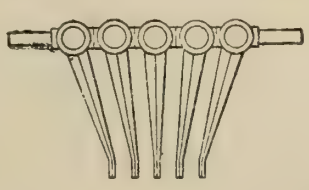

Fig. 16. For cutting blanks from ¾ in. thick up to capacity of machine.

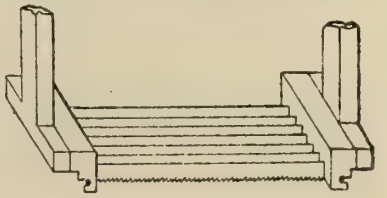
Design of Machines.

After having said this much about the blades, it is hardly necessary to point out that a machine very different from those usually employed must be designed to work them. Most of the old designs were more useful as warnings than examples. In getting out a new design, the author's ambition was to make a Reciprocating Sawing-Machine in the form of a first-class machine tool on simple and sound mechanical principles that would utilize all the duty that a high quality straight blade was capable of taking. One of the greatest faults of the machines so far in use is, that, following the example of the first machine that was made, the guide-frame is almost universally pivoted on the crankshaft, generally by a narrow bearing, thus ensuring liberty to begin with, which daily increases with wear. In this way was the first essential of a good machine missing at the outset. With a loose guide, the saw would run, make bad work, and break the blades. To avoid this fundamental defect, the guide-frame is pivoted on perfectly independent bearings, substantial and wide apart. These bearings have no other work than to guide the frame, and there is practically no wear whatever, Fig. 7. It was found necessary to stiffen the machine in every direction. The bed was made much wider, a bearing being thus given for the bar on both sides of the saw, the guide-bars were placed wide apart, all the bearings brass-bushed and ample, and in the case of the larger machines a vice was provided on both sides of the blade.

Weights were increased until a 6-inch machine weighed 5½ cwt. and a 15-inch machine 25 cwt. These weights were found necessary to make the machine perfectly firm and free from all vibration. Since the weight used on the blade was so heavy, it became necessary to adopt a convenient method of applying this from zero upwards. This is done by sliding a weight on a bar which runs from the extreme end of the frame to a point well behind the fulcrum of the swing bracket, in which position it balances the weight of the guide-bars and frame. In the heavy machines, this weight is adjusted by a quick pitch-screw, Fig. 8.



MULTIPLE SAW.

Fig. 18. Rack arrangement for cutting blanks from 1-16 in. to ¾ in. thick.

Having such a heavy weight to deal with, it next became necessary to pre-

vent the breakage of the machine in case the blade should break, and so long as the usual small boy was to manipulate the machine, it also became necessary to lift the weight by power. A perfectly reliable release was also required on the return stroke of the blade. This latter is a difficult or impossible thing to provide for satisfactorily by purely mechanical means, as the plane of the saw varies at every stroke, so that a rack-and-catch arrangement is unsuitable. The clutch principle used on some machines is also unsatisfactory, as it constantly requires a nice adjustment which is quite beyond the capacity of the boy in attendance. Experiments have shown that it is essential that the saw should be lifted off its work and put down again accurately at the extremes of the stroke. If this be not done, either the output is seriously interfered with or the blade is injured. Ultimately, to deal with all these points, a 4-function hydraulic ram (to be described later) was used on all the larger machines. This was first brought out in the form of the simple ram, as shown in Fig. 9. Here, an eccentric set in line with the crankpin on the crankshaft works a little plunger in connection with the dash-pot. This plunger comes down and closes the little port (A) exactly at the end of the stroke, thus gently lifting the frame sufficiently off its work on the return stroke and letting it gently down again, and, as soon as the working stroke begins, leaving the full weight on the blade. There are no complications and no wear in this device, as both pistons are simply made a good fit and work in oil. A foot valve is provided to let the oil in when the frame is lifted by hand. It was found to perform perfectly the function it was designed for.

Modifications were quickly followed to make it useful for other purposes. The port was made small enough to convert the largest cylinder into a dash-pot and thus made it impossible for the frame to fall, as it could only be low-

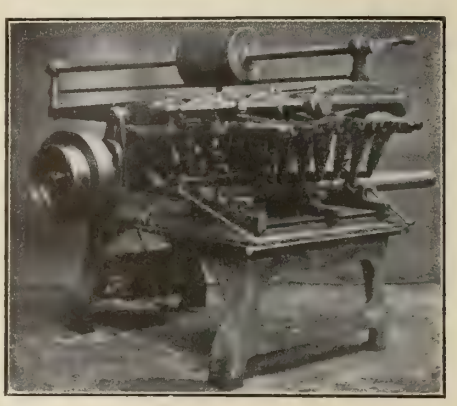


FIG. 15. 7 IN. MULTIPLE SAW FOR CUTTING BLANKS FROM $\frac{7}{8}$ in. THICK UP TO THE CAPACITY OF THE MACHINE.

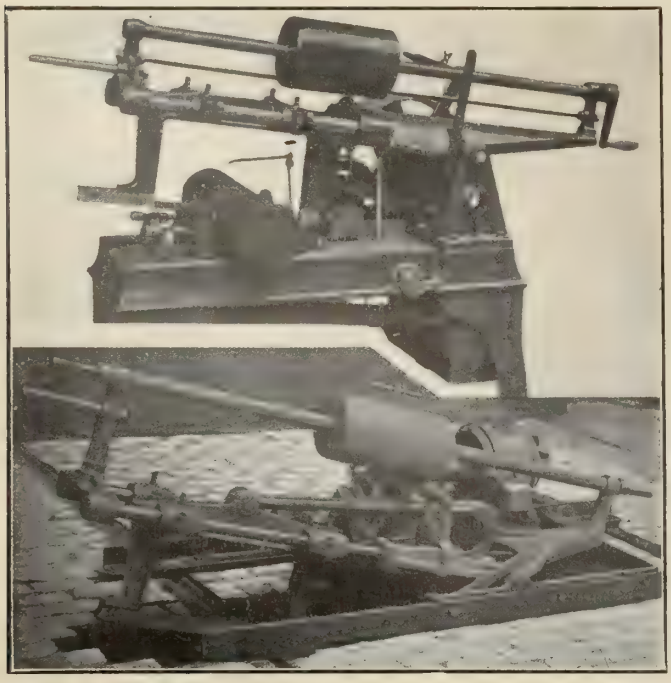
ered as fast as the oil could be pressed through the small hole, about 1-32 inch diameter in the case of the smaller machines. Soon after this, the ram was made to perform four functions by the introduction of a 4-way cock.

It is difficult to follow the exact action of this ram. but it will perhaps be sufficient to point out that this pump is provided with a 4-way cock with ports so arranged that when the handle is in the horizontal or working position it relieves the blades on the return stroke. When upright, it lifts the whole frame right off the work to any required height, the relief-port being provided to prevent it lifting too far. When in the third position, it holds the frame in the position it happens to be. When in the fourth, it lets the frame gently down whether the machine is standing or not. This last position is useful, as in its simple form this ram can only let the frame down when the port is uncovered, which it seldom is when the machine is standing.

The stroke in the author's machine is from 5 to 8 inches. The longer stroke adopted in the larger machines was not found necessary to get rid of the swarth, but simply because it was found advisable to reduce the strokes per minute, as the lengths of the frames increased, the momentum given by the small relief-lift becoming too much.

Blade Length, Stroke and Diameter of Bar.

The question of the relative length of the blade to the stroke and diameter of the bar is interesting. A long stroke should be avoided, as it entails a correspondingly long saw blade as well as a more cumbrous machine. If there is no lift on the return stroke, the stroke must be as long as the section cut, in order to get rid of the swarth. Fig. 10 shows a 12-inch section being cut with a machine having only a 6-inch stroke. The middle part of the blade (shown black) has no opportunity of getting rid of its swarth, and will therefore take the greatest part of it backwards and forwards. With a sufficient lift on the return stroke, however, the swarth is dropped and raked 6 inches forward on the cutting stroke, and it is thus only necessary to make the



FIGS. 13 AND 14. SINGLE SAWING MACHINE AND SIMILAR MACHINE FOR CUTTING TRAMWAY RAILS.

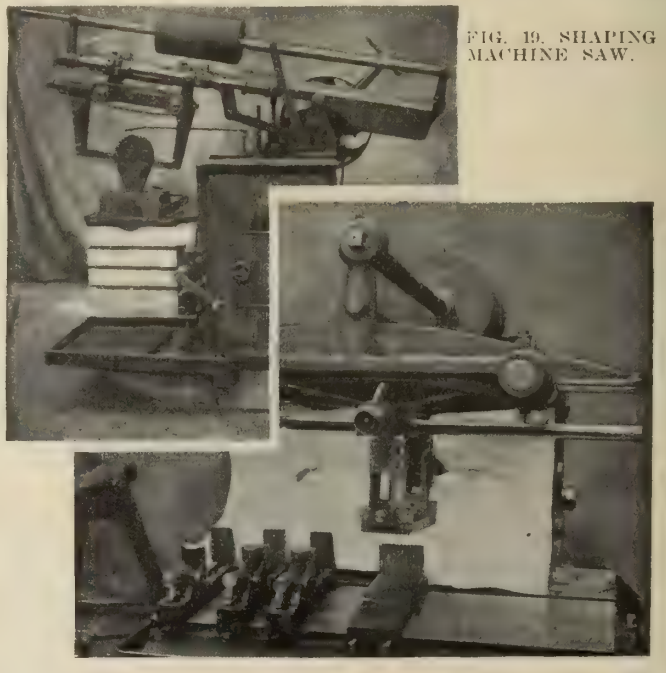


FIG. 19. SHAPING MACHINE SAW.

FIG. 17. MULTIPLE SAW RACK ARRANGEMENT FOR CUTTING BLANKS FROM 1-16 IN. TO $\frac{3}{4}$ IN. THICK.

teeth deep and large enough to hold the swarth created in two strokes.

Saw-Blade Lubricant.

The lubricant used for saw-blades is soap-suds, and great attention has been paid to the pump and tank connected therewith. The fact that the swarth made by the saws is exceedingly fine and that it is very much more difficult to make a pump to wear well with the suds than it is with oil, necessitates very careful provision to keep the swarth away from the pump and to make the pump as durable and as easy

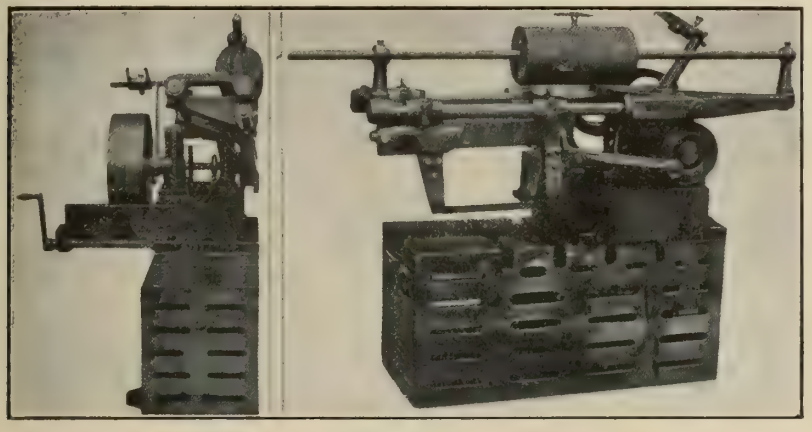

FIG. 21. SAW FOR STEEL CASTINGS.

to repair as possible. Fig. 11 shows the arrangement of tank and connections. It will be seen that the suds are first collected by a recess in the bed, and are drained at the front end, farthest away from the swarth which is carried back by the blade working on the return stroke. The suds are next conveyed through an open trough to a tank placed at the back end of the machine. This tank is divided by two weirs (if they may be so called) into three compartments. The first weir comes to the top of the tank, leaving a space about 1 inch at the bottom for the suds to pass through into the next chamber. This is done to prevent very light swarth on the top of the suds being washed over. The suds then go over the top of the second weir into the pump chamber. In this way it is seen that the swarth has four distinct opportunities of being separated from the suds, and that it is almost impossible for any grit finally to enter the pump.

Pumps.

The first thing that appeared important in connection with the pump was that it must be placed under the level of the water to avoid constant priming. Wing pumps were adopted as being the most satisfactory, but the best the author could obtain were of such a construction that they would not wear well or long with suds. The simple pump ultimately adopted is shown in Fig. 12. In this pump, a by-wash is provided, not with a separate valve, but simply by making the wings of the pump taper against the pressure, so that, when a full discharge is not required, the pressure of the suds will press these little wings back. The cover, instead of being screwed in, as is often the case, is simply fastened on with screws so that the barrel can be re-bored. Perhaps the most important feature of the design is that both wings go right through the head of the spindle and thus get an ample bearing. In these wings there are two little slots of such a length that one spring put in the middle will press up the wings on each side. The advantage of this is obvious as compared with the old method where the wings met in the middle, thus leaving but a very little bearing. The gradual wearing of this bearing caused friction and the destruction of the pump. The spindle of the author's pumps is case-hardened. The new pattern of pump has been found to be very efficient.

Results.

The result of all these improvements is that sawing can be done practically true, say to a hundredth of an inch in a 6-inch bar, and mild steel can be cut at a speed roughly speaking, varying from 1 inch to 2 inches square per minute. The breakage of the blade is exceedingly rare, and those of the best quality will often last several days.

Machine Features.

The machines are made in several forms. The Single Sawing-Machine shown in Fig. 13 is constructed for sawing pieces of large dimensions quickly and correctly. Fig. 14 shows another variety, a machine for cutting tramway rails in position. This machine rests upon two angle-irons, which in their turn rest upon the two rails. It is only necessary to disturb the pavement for the frame. The main features of the machine are standard. It makes a straight clean cut through the rails, no matter how hard, in about twenty minutes, and one blade will make from about twelve to twenty cuts before it is worn out. The Multiple Saw, Fig. 15, and Fig. 16, is specially designed to cut off blanks for dies and similar duplicate work. By a rack arrangement, Fig. 17, and Fig. 18, these blanks can be cut as thin as 1-16 inch, and with the more usual arrangement of adjustable frames, shown in Fig. 15 and Fig. 16, they can be cut from ¾ inch thick to the capacity of the machine.

What is called the Shaping Machine, Fig. 19 and Fig. 20, is another variety. This machine is provided with a table like a shaping machine on which the work is placed. By this means the work can be brought to the required position under the blades. Two blades are provided which can conveniently be be adjusted in alignment from ½ inch apart to the full capacity of the machine, usually about 5 inches. It is more particularly useful for cutting out joints of all sorts, splitting brasses, and so on.

A variation of pattern is the Runner Saw, Fig. 21. This is specially designed to cut runners off steel cast-

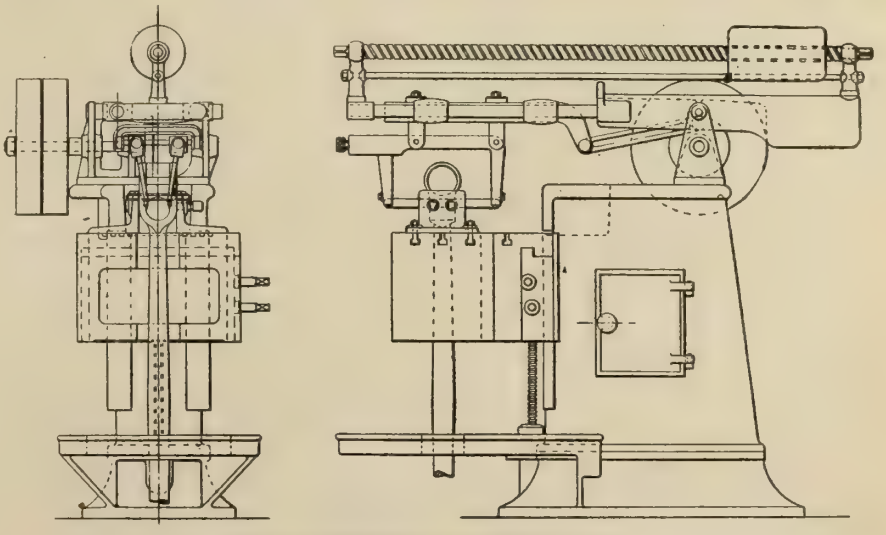

FIG. 20. SHAPING MACHINE SAW.

ings, which are bolted on the front or the side of the table. The whole head is made to traverse a foot sidewards so as to reach the runners; it can also be lifted and put forward on the bed if necessary. The saw is brought on one side of the guides so that it will cut runners quite flush to the casting where the sawholder does not foul. In the few cases where it would foul, it would cut flush within 3-16 inch. The hard blades that can be worked with this machine make this method compare favorably in many ways with the Circular or Band Sawing-Machines.

Another variety in course of construction is a machine for sawing out webs of crankshafts. Here, as in the shaping machine, there are two blades, but the table is stationary, the crankshaft being bolted down on blocks to the correct position under the blades. A horizontal blade is also provided for cutting out the bottom of the crankshaft. This third horizontal blade works independently of the two vertical ones. The frame is constructed to hold a square file as well as the saw blade. The operation is as follows:—The crankshaft must first have one hole drilled in it, say 1¼ inch or 1½ inch diameter. It is then bolted down on the blocks in position underneath the two vertical blades, and these blades are set to work. The file is threaded through the hole and attached to the horizontal frame and the hole filed out approximately square at the bottom. To accomplish this, the lower frame is attached to a table which can be raised and lowered by hand. There is also a hand-traverse in the horizontal direction. The table is provided with a counterweight so that the filing out of the hole can easily be manipulated by the two hand-traverses mentioned. After the hole is filed sufficiently square, an operation of a few minutes, the file is withdrawn and the blade threaded through instead. The horizontal blade is then put automatically to work. It is provided with a 4-function automatic ram, like the other, and works independently and precisely on the same system. There is usually so much less to saw horizontally than there is to saw vertically that the horizontal work will probably be finished some time before the vertical. When this is the case, the horizontal blade is removed and the frame drawn out of the way of the vertical saw before they approach near enough to foul. It will be thus seen that in the manipulation of the horizontal blade there is no time lost. A 9-inch by 9-inch crankshaft web may thus be sawn in 60 minutes to an accuracy of 1-64, using about 2 h.p. The outside of the webs can also be sawn at another operation, thus saving much valuable time afterwards on an expensive lathe.

In conclusion, the author would like to state that he has simply been trying to trace the development of a most useful tool so far as it has gone. He is not of opinion that anything like finality has yet been approached, but he believes that in rapidity of work, in the endurance of the blades, and in the size of the machines, the reciprocating straight-blade sawing machine is still in its infancy. The foregoing is a reprint of a paper read recently before the Institution of Mechanical Engineers.

LARGE LOCOMOTIVES.

WHAT are believed to be the largest and most powerful locomotives yet constructed are now nearing completion in the shops of the American Locomotive Company. The locomotives are intended for use on the Virginian Railway and are of the Mallet compound type. Each engine will weigh in working order 540,000 lbs. (241 long tons), with 497,200 lbs. (222 long tons) on the drivers, and the combined weight of the engine and tender will be 752,000 lbs. (336 long tons). The over-all length of the engine is 65 ft. 11¼ inc., and the total length of the wheel-base is 57 ft. 4 ins. These engines will be capable of exerting a tractive effort of 115,000 lbs., or 60 per cent. more than the pioneer of this type built in America for the Baltimore and Ohio Railroad. The tractive power at slow speeds can be increased to 138,000 lbs. by working the engine simple.

The North British Locomotive Company (Limited), of Glasgow, send us the following list of large locomotives manufactured by them:—

Engines with Tenders.				Tank Engines.
Gauge.		Engine.	Tender.

Articulated Engines with Tenders.				Tank.
3	3⅜	82 tons	35 tons	—
3	6	95½ "	43½ "	—
4	8½	96 "	—	120

Messrs. Beyer, Peacock and Co. (Limited), of Gorton Foundry, Manchester, state that the heaviest engines they have constructed are some goods engines of the Consolidation type for a foreign railway company, which weigh in full working order 78.6 tons. The eight-wheeled tenders weigh 49.2 tons, so that the total weight of the machines is roughly 128 tons.

TORONTO PLANT, MASSEY-HARRIS, LTD.

WHEN the new extensions and improvements now being made at the Toronto plant of Massey-Harris Co., Limited, have been completed, this foundry will be one of the most modern and up-to-date to be found, as well as one of the largest, in the Dominion. The foundry extension is 238 feet long by 95 feet in width, which will make the total length of the foundry proper 528 feet and the width 95 feet. With the new core department at one end and the cleaning department at the other, the length of the combined buildings is 913 feet—about three city blocks. This new extension to the foundry has a rather unique feature, consisting of a basement for the storage of sand and other materials, and a traveling conveyor for delivering these at any point desired.

Four large cupolas, each 96 inches diameter, and having a melting capacity of 25 tons per hour, are being installed. Under ordinary conditions, only two cupolas will be used, the other two being held in reserve or used on alternate days, thus giving ample time to prepare the cupola, and the iron and fuel for charging. The iron and fuel for the cupolas are loaded on small cars, raised to the charging floor on electric elevators, and by means of transfer tables the material can be brought to the cupola as required. The contents are deposited in the cupola by means of a pneumatic dump

BOILER SETTINGS.

WRITING in the Electrical Review on "Boiler Settings," Mr. Edward Ingham points out that a boiler will often work satisfactorily even when the flues are cramped and restricted, so long as it is only required to work at comparatively low power. When, however, extensions of the steam plant are made, and the boiler is called upon to develop its full power, it is unable to do so. The results of this may be very serious, for it is generally a difficult matter to remedy the evil; hence the importance of building the flues of ample capacity in the first instance. In Lancashire boilers, a mistake sometimes made is to build the fire-bridges too high. Such a mistake is liable seriously to cripple the draught, and in one or two instances which have come under the writer's notice it has been impossible to maintain steam in consequence. The removal of one or two layers of brick has entirely remedied the evil. Generally speaking, a distance of not less than 10 in. should be left between the tops of the bridges and the furnace crowns at the middle.

Lay-out and Equipment of Blacksmith's Shop--II.

By Frank Walker

The present article is a continuation of that which appeared in our May issue, and deals more particularly with the mechanical devices which quality and quantity production in our blacksmiths' shops now demand.

AS already pointed out, there are a number of tools and appliances included in the general equipment of a blacksmith's shop which may be classed as miscellaneous or occasional, being only used as necessity requires.

Machinery and tools are as necessary to the blacksmith as they are to the machinist, enabling him to produce more and better work at a reduced cost and with greater convenience to himself. In what follows I will endeavor to describe such miscellaneous tools as I consider are indispensable for the expeditious and economic output of general blacksmith's work.

The Power Hammer.

The most essential of these tools is undoubtedly the power hammer. In almost every class of smithwork, the necessity for a heavier blow than can be struck by hand is constantly arising. This fact has been recognized from early days as the old "Olivers" and helve hammers bear witness. There are many modern varieties of power hammers in use—steam, pneumatic, belt-driven, but, in the writer's opinion, the steam hammer is the most suitable for general all-round blacksmithing. With a good selection of dies and tools, it has, in the hands of skilled operators, almost unlimited scope; can be used as a vise or bar shears; for drop forging or bulldozing, and as a trimming press. It can not only be used for striking heavy blows and roughing out, but a great deal of work can, with care, be entirely finished under it.

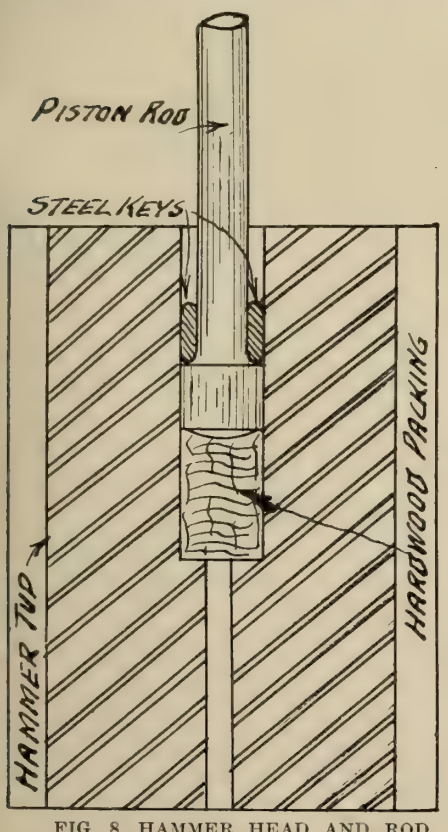

FIG. 8. HAMMER HEAD AND ROD.

In selecting and installing a steam hammer to give the greatest efficiency,

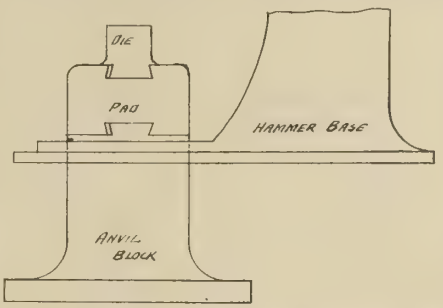

FIG. 7. ANVIL BLOCK AND BOTTOM DIE.

careful attention should be given the following details: The actuating levers, that is, those which operate the throttle and slide valves should be so arranged that the hammer driver can stand at his work in a natural and unconstrained position, having a clear and unobstructed view of the forging on the anvil and the blacksmith operating. The throttle valve should be so fitted that it will remain in any required position without attention; that it will not jar, open or shut, with the blows of the hammer, and that the driver's whole attention may then be given to the blacksmith and his signals.

The method of attaching the bottom die block to the anvil block should be as shown in the sketch, Figure 7. It will be seen that a wrought iron or steel distance piece or "pad" is interposed between the anvil and the die. The top and bottom dovetails in this pad are both females, and its thickness is so proportioned that its lower joint is an inch or so above the hammer base plate. The advantages of this arrangement are:—

(1)—There is no danger of splitting the cast-iron anvil block by overtight keying, for a split anvil block means dismantling the hammer and a heavy and expensive renewal.

(2)—It admits of the die faces being easily adjusted should they work out of true. It is a well-known fact that, however strongly a hammer foundation may be built, it will always give or settle to some extent sooner or later, very often canting a little to one side. This throws the die faces out of alignment and causes the hammer to forge taper. When this occurs, it is an easy matter to remove the pad and plane it down to suit, bringing the faces again parallel. In order, however, to provide for this contingency, the anvil block should be kept up, when installing the hammer, about ½ inch higher than the bottom piston clearance calls for.

In double standard hammers, where the piston rod is keyed into the hammer block or tup, the means of attachment should be as shown in Fig. 8. This method of keying allows the rod to be securely held and cushioned without being weakened, and has been used with the greatest success in both smithy and heavy forge hammers.

The single standard or "Rigby" type of steam hammer is the most suitable for light work, but its anvil block and dies should be set at an angle of 45 degrees with the centre line in order that long work may be forged either with or across the faces without coming in contact with the frame. For drop forging and heavy work the double standard type is most suitable, as the tup of the single standard, gland guided type has a tendency to spring or wobble from side to side when it is rapidly driven; this tendency is very noticeable in old and worn hammers.

Hammer Dies.

The top and bottom dies for general use should be made as shown in Fig. 9; the edges being square and the bottom die longer than the top. This form enables the smith to neck or break down work without using a loose or "held on" tool. The two holes shown in the bottom die will be found useful to carry stakes to prevent taper work or formers from moving side ways.

When installing the hammer, it is advisable to place, if possible, both steam and exhaust pipes below the floor level, and condensation in the steam pipe should be taken care of by an efficient drain or steam trap. If this be carefully done and the piston and valve and stem glands be kept well and tightly packed, it will obviate to a great extent the nuisance of wet hammer faces. Anyone who has worked at a steam hammer knows what an unpleasant and even dan-

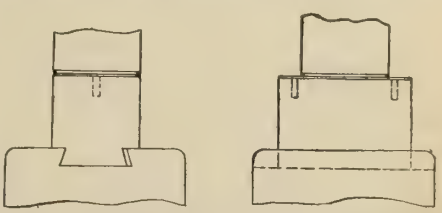

FIG. 9. SHAPE OF TOP AND BOTTOM DIES.

gerous proceeding it is to work a welding heat when the die faces are wet. The dies and loose tools used with a steam hammer are numerous and varied, their shapes and uses being limited only by the ingenuity of the operator. A good steam-hammer blacksmith will never be stuck with a job if only he is allowed the time to make efficient and sufficient tools.

Hammer General Tools.

In making swages and tools of that class for a hammer, it is advisable to make the impressions in the top and bottom halves of the tool each to equal one-half the diameter or thickness of the work to be finished, so that, by no mischance, can work be finished below size. When a steam hammer is installed and working it is best to appoint a man or boy as hammer driver and encourage him to take a pride in his machine and its work. Doing this will insure the hammer being well looked after and the best results obtained from it.

Blacksmiths' Surface Plates.

In general machine blacksmithing, men are being constantly called upon to forge odd and irregularly shaped pieces; a surface plate becomes, therefore a very necessary item in the general equipment. The blacksmith's surface plate should be strongly made, and of cast iron well re-inforced by ribs underneath. Its size should be from 5 to 6 feet long by 3 or 4 feet wide. Its face and edges should be planed and squared on one side, and one end should be scaled to inches and quarters, so that offsets and curves may be easily measured. The plate should be equipped with one or two pairs of V-blocks, a surface gauge and one or two squares of different sizes. These tools need not have the high finish of the machine shop, but should be fairly accurate. With an equipment such as this, forgings of irregular shape may be turned out within 1-32 inch of drawing office dimensions. The surface plate should be conveniently situated on the floor of the shop, supported firmly on timber blocks with its surface about 18 or 20 inches above the level of the floor.

Setting, bending or straightening should never be done on the surface plate. A substantial cast iron face block should be provided for these purposes of 4 feet or 4 feet 6 inches square with face and sides level and square but not planed; its edges and corners being rounded to different radii. A (T) slot should be planed 4 inches from one edge, in order that work may be cramped down on it for offsetting, etc. As this block is subjected to some very severe handling, it should be strongly made. The best the writer ever saw was made from a piece of 6-inch armor plate, and although its cost was excessive, it was practically unbreakable. It should be placed as close to the surface plate as convenient and supported on wooden blocks about 15 inches above floor level. Fig. 10 shows the most suitable form for this tool.

Cone for Collars, Rings, etc.

When making rings, collars or washers of large size, a cone such as is shown in

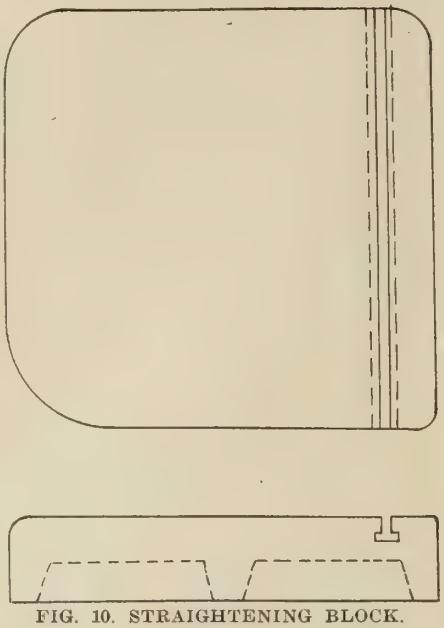

FIG. 10. STRAIGHTENING BLOCK.

Fig. 11 will be found very useful for trueing them up. Its base diameter should be 20 inches, its apex 4½ inches and its height 45 inches. It should have a (U) shaped slot running down, which gives clearance to the tong-bitts when placing or removing the work.

Vise Equipment.

One or two vises will be found very useful, but the benches to which they are attached should be made as small as convenient, or else they are liable to become a dumping ground for odds and ends. The best type of vise for blacksmith's work is the "Peter Wright" knee vise with 7-inch jaws, weighing about 120 pounds. It should be mounted on a wooden stand not more than 2 feet square, with the legs well splayed outwards at the feet to prevent rocking. This arrangement will be found to answer every purpose and can be moved about the shop as desired.

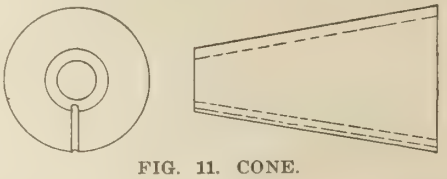

FIG. 11. CONE.

Emery Wheel.

An emery wheel for tool grinding must be provided. It should be of the wet grinder type and protected. A dry, unprotected emery wheel is apt to be used as a forging machine, which is bad practise for the stone and the smith. The grinder should be so situated in the shop that it is well under the foreman's eye, or else it is liable to become a gathering ground for loafers.

Shearing Machine.

A shearing machine that will cut round, square or flat stock up to two square inches in area will be found useful. It should be situated in close proximity to the bar rack. Stock can then be cut to suitable lengths by this means much quicker than on the anvil.

Blast Trunk and Blower.

Before concluding this paper I would call attention to a bad practice which obtains in some blacksmith's shops—that of placing the blast trunk and blower above the level of the forges. This is sometimes done to economize space but it is not to be recommended. During the dinner time shut down, while the fires are smouldering, gas may leak into the blast trunk through an unclosed wind gate. When the blower is again started up, this gas is forced back into the fires, and may cause an explosion that will wreck both the blast trunk and the blower. The best position for blower and blast trunk is at least 2 feet below the level of the tuyeres. This will prevent accidents by explosions, as gas being lighter than air cannot descend, unless it be forced.

WHY DO BUSINESS MEN FAIL?

By W. C. Holman.

ACCORDING to the report of Bradstreet's, 12,646 failures occurred in the United States during 1911, and of this number 3,414 were directly attributable to incompetence. The percentage due to the various causes is tabulated as follows:—

Lack of capital	13.4
Incompetence	27.0
Specific conditions	16.9
Fraud	10.6
Inexperienece	41.1
Competition	2.9
Neglect	2.2
Unwise credits	2.0
Failures of others	1.3
Extravagance	.9
Speculation	.7

There is a world of difference between the plus salesman and the minus salesman. The plus salesman is always bringing reasons to bear why a prospect should buy, and he gets plus business; the minus salesman is busy removing reasons why his customers think they should not buy, and he gets minus business.

British and American Machinery Exports Compared

From The London Times

This article is written from a British standpoint and discusses frankly, backed by figures more or less reliable, the gigantic strides being made by the American manufacturer in obtaining for his product an increasingly world-wide clientele in spite of disabilities of nationality or Imperial ties.

OF all the competitors which Great Britain has to meet, alike in the machinery markets of the British Dominions and in the neutral machinery markets of the world, the United States is by far the most formidable. A good second, at least, to Germany in scientific method and organization, at least her equal in commercial enterprise, and her superior in practical resource and invention; with a wider, more varied, and more extended experience in the application of mechanics to industrial uses, and with a superior class of technical executive labor, the United States, if not quite the best equipped country in the world for an international trade in machinery, is surpassed only by the United Kingdom.

Her chief, perhaps her only, disadvantages lie, first, in the high cost of her raw materials, notwithstanding that she can obtain all of them within her own borders; and, second, in the high cost of her labor. The former places her at a disadvantage in relation to the United Kingdom only; the latter represents a general and serious handicap. It may, however, be questioned whether these disadvantages are not more than counterbalanced by the adaptability, resource, enterprise and persistence which characterize American machinery builders.

Importance of Machinery Exports.

It is unnecessary to dwell upon the importance of the external machinery business to this country. It is one of the great branches of industry of which it may be said that we have all the necessary materials at home, and in which we still lead the world. Our experience in this particular branch, our international connections, and our shipping facilities are superior to those of any other manufacturing nation. With the great market represented by British India we have sentimental and practical ties of enormous value possessed by no other country, while in the important markets represented by the great self-governing British Dominions we have fiscal advantages of appreciable value. It would, therefore, be remarkable and lamentable if, with these advantages, we failed to retain the premier position among the world's purveyors of machinery which we hold at present. Nevertheless, that possibility appears to be in view. The export trade in machinery of the United States has now become as important as the corresponding trade of the United Kingdom. Among the great classes of commodities which the United Kingdom sends abroad, machinery now occupies the fourth place; among those which the United States sends abroad, machinery occupies the third position.

In the figures for British exports in the year ended December 31, 1911, cotton manufactures represented a value of $514,697,625; iron and steel products, excluding machinery, $218,651,460; coal, coke and other fuel, $192,236,770; and machinery, including agricultural implements, $157,893,215. In the United States, for the fiscal year ended June 30, 1911, the exports of raw cotton were worth $609,707,150; meat and meat products, $152,193,775; machinery, including agricultural implements, $146,819,715; and iron and steel, $131,454,915.

It is unfortunate that the comparison cannot be made quite exactly, because the fiscal years of the two countries end at different periods; but in a more exact statement the relative positions of the classes would not be altered. Agricultural implements are included with machinery in the above figures, and will be in the statements which follow, for the reason that in the grouping adopted by the American authorities it does not appear quite clear where "machines" end and mere "tools" or "implements" for hand use begin. The inclusion of "implements" is, undoubtedly, to the advantage of the American figures, making them relatively larger than they would otherwise appear. Nevertheless, making full allowance for this circumstance, it is rather startling to discover that the value of the machinery which the United States sent abroad last year was not much more than $10,000,000 below that of the machinery sent overseas by the United Kingdom.

Progress of the Two Countries.

This circumstance suggests an inquiry as to the progress of the struggle between the United Kingdom and the United States for the machinery markets of the world, and inspection of the figures for the last 15 years strongly indicates the conclusion that the supremacy so long enjoyed by Great Britain in the machinery markets of the world is being seriously threatened. In passing, it may be noted that while 1907 remains the "record" year of the United Kingdom, the maximum of the United States was reached last year, when, as already mentioned, she came within measurable distance of the United Kingdom.

From the figures given below, it will be seen that in the period of five years, 1902-06, the United States made an astonishing advance. The increase which she secured in value in that period exceeded the increase made by the United Kingdom by $45,000,000, while the ratio of that increase over the previous period of five years was more than 2½ times as great as the corresponding ratio shown by the figures of the United Kingdom. The figures for the period of five years just concluded are much more satisfactory from the British point of view, and, indeed, are distinctly encouraging. The British increase exceeds the American by nearly $30,000,000 in value; and, while the rate of increase in the United States has fallen appreciably, that shown by the British figures has nearly doubled.

Quinquennial Growth in Machinery Exports.

PERIOD.		U.S.A.	U.K.
1897-1901	Value .....£	56,014,200	£ 93,707,847
1902-1906	Value	83,366,328	112,131,170
	Increase ..	27,352,328	18,423,323
	Per cent...	48.83	19.66
1907-1911	Value	119,108,000	153,596,657
	Increase ..	35,763,075	41,465,487
	Per cent...	42.89	36.98

This statement may be advantageously supplemented by the following, which shows the figures of the machinery exports of the two countries for the last five years:—

	U.S.A.	U.K.
1907	£ 24,141,267	£ 32,230,127
1908	23,734,663	31,430,279
1909	19,355,932	28,519,271
1910	22,512,791	29,848,337
1911	29,363,347	31,578,643
Totals	£119,108,000	£153,606,557
Average	23,821,600	30,721,311

A curious parallelism runs through these detailed figures for the last five years; whenever there is a decrease in the figures of the United States there is also a decrease in those of the United Kingdom, and when there is an increase in the one there is an increase in the other. Unfortunately, while the gain in value in 1911 in the case of the United States amounts to $34,000,000, the corresponding gain in the British figures is only $8,500,000.

Some Detailed Comparisons.

It would be interesting and useful to compare the exports of these two great trading countries class by class, but, unfortunately, this can be done only to a very limited extent. Possibly an Inter-

national Convention may some day provide a uniform classification of commodities so far as the Custom Houses of the principal trading countries are concerned, but at the moment each such authority is a law unto itself. So far as a comparison can be usefully made between the United Kingdom and the United States under existing conditions it is set out in the following statement:—

Machinery Exports, 1911.

	U.S.A.	U.K.
Agricultural (Mowers, Reapers, Ploughs, Cultivators)	£ 5,141,488	£ 1,566,868
Other Agricultural and Implements	2,352,942	617,965
Agricultural Steam Engines	.....	1,172,981
Typewriting Machines	2,037,186	26,188
Metal Working, including Machine Tools	2,005,617	759,490
Sewing Machines	1,883,200	1,771,425
Electrical	1,671,796	1,790,719
Mining	1,461,976	1,034,503
Locomotives, rail	824,676	2,307,620
Traction Engines	755,799	469,774
Other Prime Movers, including Gas and Oil Engines	1,763,978	5,661,139
Textile	.....	6,779,231
Pumps	741,834	.....
Cash Registers	671,851	.....
Printing Presses and Accessories	604,625	.....
Sugar Machinery	539,763	.....
Wood-working	380,825	.....
Shoe-making	343,348	.....
Windmills	302,081	.....
Laundry Machinery	257,002	.....
Refrigerating and Ice-making	128,371	.....
Adding Machines	176,198	.....
Brewers' Machinery	36,554	.....
All other classes	5,282,483	7,620,740
Totals	£29,363,347	£31,578,643

It may be remarked, in passing, how much more complete and detailed are the American returns than those of the United Kingdom. The British exports of pumps, of sugar machinery, of refrigerating and ice-making plant and of printing machinery probably exceed those of the United States; and as the British authorities have the figures they might just as well be published in the usual way.

Notable Features in U. S. Figures.

It will be observed that the great strength of the United States lies in the agricultural classes of machinery, in typewriting machines and in machine tools, while the figures for mining machinery and traction engines also exceed those of the United Kingdom. American supremacy in these classes is undoubtedly due to the peculiar inventiveness and resourcefulness of the people, and their singular talent, which the necessities of their country have developed, for economizing labor by the application of mechanical means to the most unlikely operations of daily life, coupled with their capacity for industrial and commercial organization. Even so, the miserable position which the United Kingdom occupies in regard to typewriting machines cannot be regarded with equanimity.

Where American genius and methods are applied in the United Kingdom to an industry of an analogous character, the manufacture of sewing machines, then this country can secure as large a foreign trade, as will be seen from the above figures. The question then is inevitable—Why is there not in the United Kingdom a business in the manufacture of typewriting machines, employing British capital as well as British labor, comparable in importance with the business of manufacturing sewing machines? It is to be feared that the answer is to be found in British indifference and failure to recognize a great opportunity.

Features in U. K. Figures.

It is satisfactory to note British supremacy in all the heavier classes, with the exception of mining machinery, but including both electrical machinery and railway locomotives. The lead of the United Kingdom in textile machinery is overwhelming; practically no machinery of this class is exported from America, while the value of the British business is nearly $35,000,000. The immense advantage in connection with prime movers which the United Kingdom enjoys over her great competitor is another agreeable feature. Still, notwithstanding the satisfactory features revealed by these figures, the most striking and important fact which they display is that, while the exports of the United Kingdom for last year are slightly less than those of five years ago, the American figures have increased by more than $25,000,000. It is clear there can be no relaxation of effort on the part of the machinery builders of this country if they are to maintain their hold on the machinery markets of the world.

MULTIPLE-VOLTAGE ELECTRIC TRACTION.

A PATENT recently issued to Mr. H. Ward Leonard, Bronxville, New York, is concerned with means and methods for operating electrical vehicles over long distances by the use of high-tension current, and through cities, towns, tunnels, or other desired sections at a relatively low and safe tension. A number of different locomotive arrangements are covered, employing alternating current high-tension energy and both alternating and direct current low-tension supply with provision motors for either direct or alternating current.

When direct-current motors are employed with alternating-current supply, motor generator sets are used on the locomotive. If a high tension single-phase supply is used, the current is led from the working conductors through moving contacts carried by the locomotive to two single-phase motors, each of which is directly connected to a generator. These generators, which are preferably of the low-tension direct-current type, supply the propulsion motors. The pressure in the motor circuit is regulated by varying the strength of the generator fields, which are supplied from a separate generator through reversing rheostats. When the locomotive enters a low-voltage direct-current section, a switch brings the field of one of the generators under the control of its rheostat. This is adjusted to relieve the generator of its load, and the latter is connected to the low-tension source of supply. The high-tension supply circuit is then transferred to this generator, which now operates as a motor to drive one of the single-phase motors as a generator. The power from this unit is employed to drive the other single-phase motor, and this in turn drives the other generator to which it is connected.

SAW MILL REFUSE AS PRODUCER GAS FUEL.

THE value of sawmill refuse as a fuel in gas producers is the title of an interesting paper which was recently read before the Association of Engineering Societies in the United States, by Mr. Charles E. Snypp. In the course of the paper the author remarks:—"The refuse that we use is known as 'cypress hog.' It consists of about 50 per cent. of sawdust and 50 per cent. of chips such as are discharged from the "hog," which is a machine used by sawmills to destroy their refuse. This material runs from 30 to 55 per cent. moisture, and this moisture seems to be necessary for best working conditions. We have to guard against the sawdust blowing over into the pipes which conduct the gases to the wet scrubber. This is probably a local trouble, due, no doubt, to the strength of the blast that we use in order to get capacity. We have been able to realize full capacity using sawmill refuse, and our engines deliver a brake horse-power on about 4½ lb. of this fuel.

The changes necessary to fire sawmill refuse are merely the removing of the coal dump hoppers and substituting a hollow cylinder about 10ft. high, slightly tapered and made larger at the bottom, and fitted with a slide gate, both top and bottom. These slides are worked with levers and the sawmill refuse is locked into the producers through these tubes. To start firing a producer with sawmill refuse it is not necessary to have an underlying bed of cinders or ash to cover the blast pipe."

Current Topics

Acetylene Gas. — Although acetylene gas was discovered in 1836, it was not until 1892 that its commercial development was made possible by Willson, who discovered a method of producing calcium carbide in large quantities. The application of acetylene to heating and power has been very recent indeed, and the use of acetylene and oxygen in the blow-pipe has produced almost the highest temperature known to chemistry —a temperature approximating that of the electric arc, probably above 6,000 deg. Fah. Through this means, welding has been successfully accomplished and several other important industrial applications have been found. Large steel bridge girders can thus be cut apart with ease.

Burst Boiler Tube.—An examination of a burst boiler tube, which was weldless, showed it to be composed of very mild steel. Hard scale, scraped off the outside of the tube near the fracture, contained a high percentage of sulphide of iron (S = 1.65 per cent.). This sulphur is considered to have been reduced from the sulphurous gases due to combustion; and as this reduction cannot take place below 750 deg. Fah., it is safely thought that the portion of the tube where the scale was found had been kept above this temperature for some time. Micro-sections were made of several parts of the tube, which proved that the metal consisted of martensite. The only method of producing martensite is by heating steel to a temperature 1,090 deg. Fah. and above and suddenly lowering it. This observation appears to point to the fact that at the time of the explosion the tube had been heated above 1,090 deg. Fah.

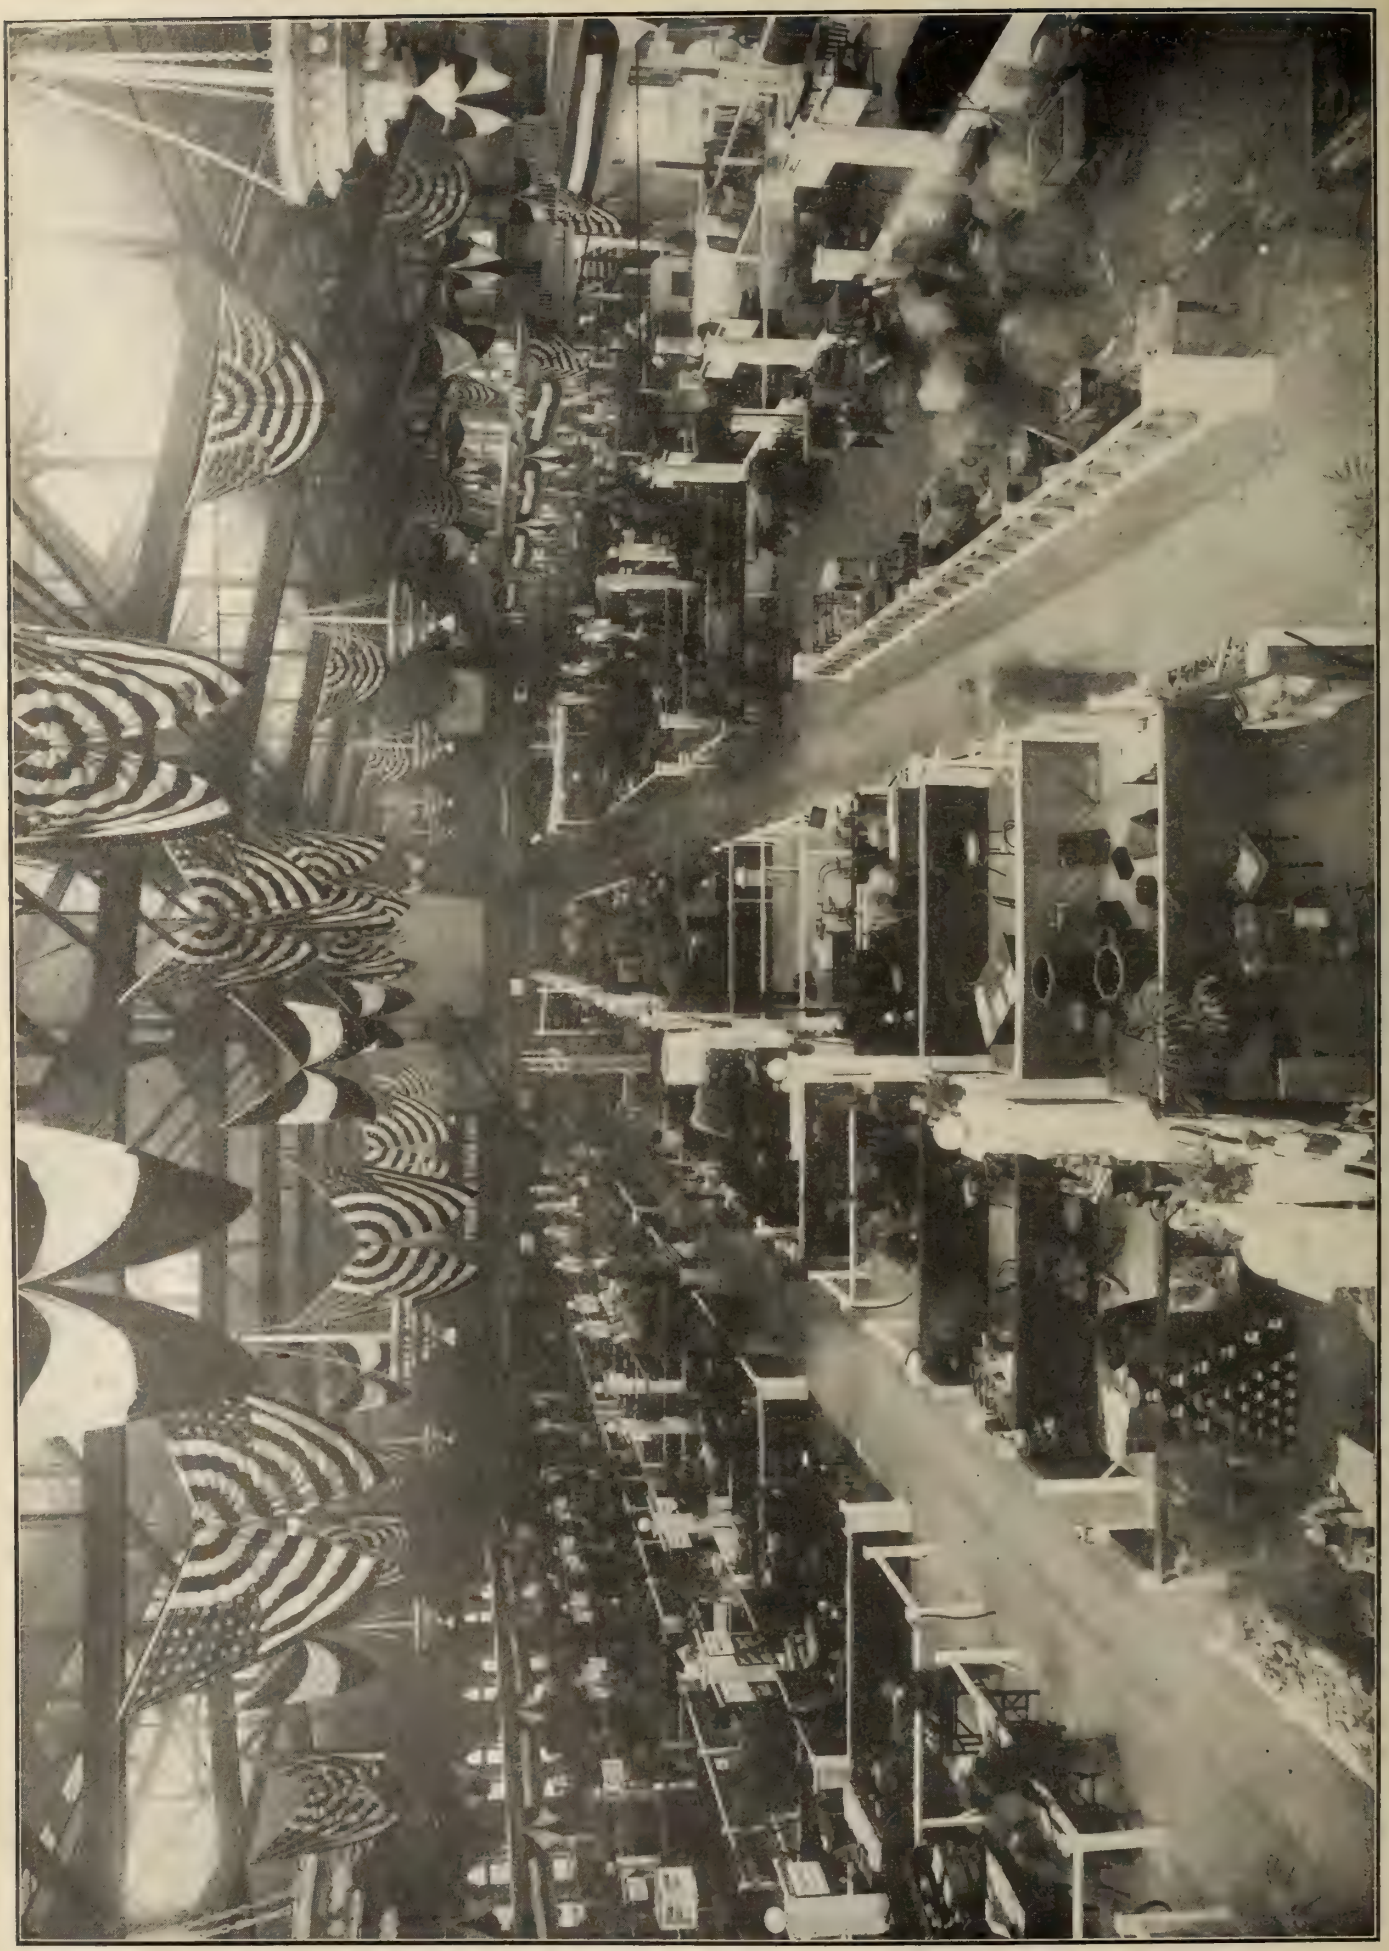
Electric Railway Operation.—In a paper read before the American Institute of Electrical Engineers dealing with economies in electric railway operation, the selection of improper gear ratios is pointed out as a source of enormous loss to the operating and manufacturing companies. Few people who have not made a study of the subject realize its importance, and there are many motors in service which are so geared as to result in a continual loss to the operating company. The large American corporations have been realizing more and more in recent years the disadvantages of high-speed gearing and some of them are now making wholesale changes in this respect, reducing the maximum speeds and making savings of 5 per cent. to 12 per cent. in power consumption, besides greatly reducing the temperature of the motors.

Corrosion Tests of Pipes. — Results have been recently published of cold-water corrosion tests made in 1 in. pipes 30 ft. long, the temperature range being 50-70 deg. Fah. The test lasted for nine days. Hot water tests at 125-135 deg. Fah. were also made in pipes 5 ft. long with similar fittings, the tests lasting three days. Mechanically filtered water was found to be much more corrosive than the original supply; water from a slow sand filter usually slightly more corrosive; a pond supply, showing virtually the same alkalinity, very corrosive; as was also a driven well supply. Treatment with lime decreased slightly the corrosive action, while soda had little effect. Heat, both in iron and galvanized iron pipes, greatly increased corrosive action. Alkalinity with lime increased corrosion with cold, but had a reverse action with hot water. In every case galvanized iron pipes showed less action than iron pipes, defective coating or thread cutting no doubt being to blame. Dissolved oxygen greatly assisted corrosion, the oxygen in the water being greatly diminished after the test. The removal of small amounts of protective organic matter was held responsible for the increased corrosion of filtered waters.

Power Station Working. — With an economizer of ample size, states Mr. J. W. Jackson in a paper on "Power Station Working," it is now possible to obtain overall boiler and economizer efficiencies of as high a figure as 85 per cent. Economizers are now so robust that they are looked upon as quite automatic and often left to themselves for more or less long periods. At the same time, close attention to economizers is well repaid in prolonging the life of the metal as well as keeping the economizer casing air-tight. By looking after air leaks in a boiler and economizer combined in regular commercial service, it is possible to reduce heat losses going up the chimney to about 10 per cent., whereas a neglect of precautions will allow these losses to rise to as much as 30 per cent. and still afford little evidence of what is going on by observation of the color, which, of course, means the temperature of the flame in the furnace. The economizer of the future, Mr. Jackson considers, is undoubtedly one built on what might be termed the "contraflo" principle, wherein the water is caused to circulate through so many sections in series. Experiments have already been carried out on these lines with beneficial results.

Generation of Steam.—It has recently been maintained by Mr. George Wilkinson, the chief electrical engineer of the Harrogate Electricity Works, that the generation of steam calls for a radical change in present day practice. He maintains that we have too long been content to use boiler plant, furnishing an average of from 2 lb. to 3 lb. of steam per hour per square foot of heating surface. Such practice involves the use of enormous boiler plants out of all proportion to the size of the generating plants. Reference to the plans of modern works equipped with from 10,000 to 20,000 kilowatt units of power show a separate boiler-house for each generating plant. These boiler-houses are built end-on to the power-house, and impose a heavy capital cost for boilers, buildings, flues and chimneys. They also involve heavy losses in boiler, steam pipe and flue radiation. The solution of these difficulties, Mr. Wilkinson considers, appears to lie in the introduction of gas firing, by means of flameless surface combustion on the lines first discovered by Sir Humphrey Davy, and more recently developed and set out by Professor Bone in his lectures before the Royal Institution of Great Britain in 1911. So far as investigations have gone at present, it is shown that an evaporative duty from boilers exceeding 20 lb. of steam per square foot of heating surface, can easily be obtained with a thermal efficiency corresponding to the transmission to the water in the boiler of nearly 95 per cent. of the energy represented by the net calorific value of the gas.

Moulds.—The moulds of the latter Bronze Age were either of clay or bronze. In casting swords and daggers of bronze the moulds must have been of clay and been heated to dull redness at the time when the metal was poured in—a method of casting which is still practised in Japan—as by no other means could such perfect castings of their thin blades have been obtained. The castings generally were hammered at the cutting edges, and it is to this hammering, and to it only, that the hardness of the cutting edges of both copper and bronze weapons is due, and not to any method of tempering. Much has been written about the so-called art of tempering bronze supposed to have been practised by the men of the Bronze Age in the manufacture of their weapons. The hardness is also said to be greater than can be given to the bronze at the present day. Mr. William Gowland has recently pointed out that this is an error, and has expressed the opinion that it can only have arisen owing to its authors never having made any comparative practical tests of the hardness of bronze.



GENERAL VIEW OF THE EXHIBITION HELD IN CONNECTION WITH THE RECENT CONVENTION OF THE ALLIED FOUNDRY ASSOCIATIONS AT BUFFALO, N.Y.

The Foundrymen's Convention and Exhibition at Buffalo

Among the many hundreds of delegates attending the recent Foundrymen's Convention at Buffalo, N. Y., it was universally agreed that this year's meeting was one of the most successful yet held. The quality of the papers read at the various meetings was of a high order, while their scope embraced the entire field of the metal founding industries. The exhibition of foundry equipment held in connection with the Convention was also a most successful affair from every point of view.

THE seventeenth annual convention of the American Foundrymen's and Allied Associations was held in Buffalo from Sept. 23 to Sept. 27 inclusive, and was undoubtedly one that will tend to strengthen the various bodies to a marked extent.

Each association had its headquarters at a different hotel and there the business meetings and readings and discussions of the numerous papers took place. The American Foundrymen's Association were located at the Hotel Statler, the American Institute of Metals at the Iroquois, while the Associated Foundry Foremen gathered at the Hotel Broezel.

Exhibition Features.

The Foundry and Machine Exhibition Co. held their exhibit in the Broadway Arsenal, a spacious building excellently suited to the purpose. Here were to be seen the leading products of over one hundred manufacturers of foundrymen's requirements, forming perhaps an even more comprehensive collection than that at Pittsburg last year. Among the numerous molding machines exhibited many showed improvements in design over those of last year; though on the whole really novel features were not very noticeable. The prominence given to sandblasting outfits was especially noteworthy, and this method of cleaning castings seems to be coming into well-nigh universal use. Some of the self-contained machines for sand-blasting small castings were very complete and appeared to be quite dustless in operation. Jolt ramming machines were shown with capacities ranging from 100 lbs. to 80,000 lbs., many of them being shown in operation, as were the majority of the molding machines. Exhibits of facings, partings, core binders and similar lines were numerous, in fact every branch of foundry equipment was well represented.

The exhibition was open each day from 9 A.M. to 10 P.M., and attracted large crowds, wro evinced great interest in the fine display.

Convention Sessions Opened.

The executive sessions of the three organizations of the allied foundry associations were launched on Tuesday morning, Sept. 24th, when the American Foundrymen's Association, the American Institute of Metals, and the Associated Foundry Foremen met together at the Hotel Statler under the presidency of Major Joseph T. Speer, President A. F. A. The delegates were welcomed by Mayor Fuhrman, of Buffalo, who was followed by Orson E. Yeager, president of the Buffalo Chamber of Commerce. A cordial reply on behalf of the three associations was made by A. E. Howell, Nashville, Tenn., who is one of the vice-presidents of the A. F. A. An adjournment shortly afterwards took place to make way for the regular meeting of the American Foundrymen's Association.

Major Speer gave a brief presidential address, in the course of which he recommended that the constitution be made more elastic with a view to rendering co-operation between the various associations of more effect. This suggestion was followed by a motion, which was carried, that a committee be appointed to revise the by-laws.

Secretaries' Reports.

Dr. Richard Moldenke, secretary-treasurer of the American Foundrymen's Association presented an interesting annual report. He said that the association had suffered considerably from the recent depression in the foundry industry, fully 15 per cent. of the members having either resigned or having had to be dropped from the roll. A vigorous campaign for new members had, however, served to recover some of the lost ground with the result that the present membership amounted to 626, with fresh names coming in daily. This showed, better than anything else, the resumption of business activity and business optimism. After some further remarks on the same subject Dr. Moldenke went on to say that a great interest was now being taken in the A. F. A. by the men in the malleable casting and steel casting trades, which augured well for those industries, as a frank discussion of methods of manufacture eliminated waste and educated the consumer up to what can and what cannot be done in the foundry. The financial portion of the report was very satisfactory, the total income for the year ending July 1, 1912, having been $5,162.09, and the total expenditure $4,793.53; leaving a balance in the treasury of $368.56.

The report of W. M. Corse, secretary-treasurer of the American Institute of Metals, showed this body to be in a very flourishing condition. The membership had steadily increased until it now stood at a total of 310. Mr. Corse was followed by A. D. Little, official chemist to the Institute, who presented his first annual report. This dealt with the progress and developments that have taken place during the past year in the non-ferrous casting industry. Mr. Little dealt with the subject in an extremely interesting and attractive manner.

Excellent Papers Read.

At the morning and afternoon sessions of the A. F. A. and the A. I. M. a large number of high class papers were read and gave rise to some interesting discussions. A partial list of these papers was given in the September issue of Canadian Foundryman, and the more important of them will be published in our columns in due course.

Entertainments, Etc.

The local entertainment committee, under the chairmanship of Frank B. Baird, arranged an attractive programme for the delegates, special provision being made for the large number of lady visitors who attended the convention. The latter on Tuesday morning were conveyed by special train to East Aurora, where the Roycroft shops were visited. In the evening the Foundry Foremen held their banquet, while their ladies visited Shea's theatre. On Wednesday afternoon there was a steamboat excursion in Buffalo harbor, down the Niagara River and around Grand Island, free to all registered delegates, both ladies and gentlemen. On Thursday morning the ladies were taken for an automobile tour of the city, afterwards visiting the Larkin Company's plant, where luncheon was served. On Thursday evening there was a well attended subscription banquet at the Hotel Statler, and a theatre party at Shea's for ladies registered at the headquarters of the A. F. A. and A. I. M.

Foundries Inspected.

The following plants threw open their doors to the visiting delegates, large numbers of whom took advantage of the courtesy thus extended them:—Acme Steel & Malleable Iron Works; Aluminum Castings Co.; Buffalo Pitts Co.; Bingham & Taylor; Buffalo Foundry & Machine Co.; Frontier Iron Works; Jewell Steel & Malleable Iron Co.; Strong Steel Foundry; Atlas Steel Foundry; H. G. Trant; Ginther's Sons Co.; Lumen Bearing Co.; Pratt & Letchworth; Buffalo Forge Co.; Farrar & Trefts (East Buffalo Iron Works).

Canadian Delegates.

Among the large numbers of Canadians present we noticed the following:—E. A. Morrison, Canada Foundry, Toronto; T. J. Best and J. A. Robinson, War-

den King Ltd., Montreal; H. Goodes, John Inglis Co., Toronto; W. R. Gilmore, W. Shand, G. W. Duggan, R. Broad and W. Cox, Canadian Steel Foundries, Welland; J. F. Gaffney, Drummond, McCall Co,. Montreal; Chas. J. Caley, Canadian Yale & Towne, Ltd., St. Catharines; T. R. Lagan and W. Hackadon, Waterous Engine Works, Brantford; F. J. Ross, Dominion Foundry Supply Co., Toronto; J. Howard and J. A. McLaren, The Galt Brass Co., Galt; H. O. Kerr, Kerr Engine Co., Walkerville; A. G. Storie, Ontario Malleable Iron Co., Oshawa; Percy C. Brooks, A. Dawson and J. H. Anisborough, Canadian Fairbanks-Morse Co., Toronto; G. J. Reichert, Pratt & Letchworth Co., Brantford; Rupert G. Bruce, Canadian Hanson & Van Winkle Co., Toronto; H. V. Tyrrell, J. H. Williams and F. T. Young, "The Canadian Foundryman," Toronto; L. L. Anthes, Anthes Foundry, Toronto; W. H. Davis and W. A. Jackson, Steel & Radiation, Ltd., Toronto; F. Wedlake and A. E. Williams, Cockshutt Plow Co., Brantford; J. R. Phillips, Pease Foundry Co., Toronto; S. B. Chadsey and C. H. Grobb, Massey-Harris Co., Toronto; Arthur Smith, Canadian Ingersoll-Rand Co., Sherbrooke; J. H. Fryer, H. Erbe and R. Sullivan, Galt Malleable Iron Co., Galt; A. J. Palmer and J. Barter, Empire Mfg Co., London, Ont.; T. L. Moffat, Moffat Stove Co., Weston; Geo. Baird and Sherwood Lake, Waterous Engine Works, Brantford; W. J. Verity, Verity Plow Co., Brantford; J. Kelley and T. Hopkins, Guelph Stove Co., Guelph; A. G. McIntyre and F. Campbell, Foundry Specialties, Ltd., Toronto; F. E. Lauer, Foss & Hill Machinery Company, Montreal; D. M. Galloway and A. McAllister, Canadian Northern Railway, Winnipeg; H. E. Oulette, F. Hyde & Co., Montreal; H. G. Walker, Specialty Manufacturing Co., Grimsby, Ont.; A. D. Mathieson and J. Linklater, International Harvester Co., Hamilton; J. H. Eastham, The John McDougall Caledonia Iron Works, Montreal; C. M. Rudel, Rudel-Belknap Machinery Co., Montreal; H. S. Carter, R. J. Mercur & Co., Toronto; W. J. Thompson and W. T. Cole, Hamilton Facing Mills, Hamilton; A. E. Pipher, Standard Ideal Co., Port Hope; Colin Osborne, Autocall Co., Hamilton; W. D. Varey and C. Biehl, Western Foundry, Wingham; P. McMichael and S. H. Todd, Dominion Radiator Co., Toronto; M. J. Allen and A. Chase, Sawyer-Massey Co., Hamilton; J. W. Jamieson and F. R. Elbert, Bowes, Jamieson Co., Hamilton; P. Whitfield and F. W. Head, John Deere Agricultural Works, Welland; H. V. Hamilton, Steel Company of Canada, Hamilton; C. E. Rahder, Bowmanville Foundry Co., Bowmanville; G. A. Watson, Meaford Wheelbarrow Co., Meaford; T. H. Gilvear, Berlin Machine Works, Hamilton; T. L. Taylor and J. M. Moore, The McLary Mfg. Co., London, Ont.; W. Wilson, Galt Foundary Co., Galt; H. E. Mallett and E. Austin, McKinnon Dash Co., St. Catharines; H. F. White, The Geo. White & Sons Co.. London, Ont.; A. J. Oliver, The R. McDougall Co., Galt; R. Rutledge, Gould, Shapley & Muir, Brantford; F. S. Ferguson and T. P. Charlton, Canada Iron Corporation, Montreal; E. B. Fleury, Hamilton.

Next Year's Convention.

At the final session of the American Foundrymen's Association on the afternoon of Thursday, Sept. 26, it was announced that invitations for the 1913 Convention had been received from Milwaukee and Chicago, while San Francisco was desirous of securing the honor in 1915—that being the year of the proposed Panama-Pacific Exposition. The choice of a city for the 1913 Convention will be made by the executive at a later date and announced in due course.

A. F. A. Officers.

The officers of the American Foundrymen's Association for the ensuing year were elected as follows:—President, H. D. Miles, Buffalo, N.Y.; Secretary-treasurer, Dr. Richard Moldenke, Watchung, N. J.; Vice-Presidents, F. B. Farnsworth, New Haven, Conn.; T. L. Richmond, Buffalo, N. Y.; Walter Wood, Philadelphia, Pa.; A. E. Howell, Nashville, Tenn.; R. A. Bull, Granite City, Ill.; T. W. Sheriff, Milwaukee, Wis.; D. R. Lombard, Augusta, Ga.; and S. B. Chadsey, Toronto, Ont.

In recognition of his valuable services to the Association during his two terms of office, the retiring president, Major J. T. Speer, was unanimously elected an honorary life member of the A. F. A.

A. I. M. Officers.

At the closing session of the American Institute of Metals the following officers were elected:—President, L. W. Olson, Mansfield, Ohio; Secretary-Treasurer, W. M. Corse, Buffalo, N. Y. Vice-Presidents: Rolling Mills, W. H. Bassett, Ass't Supt. American Brass Co., Waterbury, Conn.; New England district, W. L. Belknap, President Belknap Mfg. Co., Bridgeport, Conn.;Pennsylvania district, Jesse L. Jones, Westinghouse Electric & Mfg. Co., East Pittsburg, Pa.; New York and New Jersey district, F. Reidenbach, Genesee Metal Co., Rochester, N. Y.; Chicago District, Philip Mueller, Supt. H. Mueller Mfg. Co., Decatur, Ill.; Michigan-Ohio district, F. O. Clements, National Cash Register Co., Dayton, Ohio; City of Chicago, Wisconsin, etc., C. E. Hoyt, Lewis Institute, Chicago; Virginia & South, G. H. Clamer, Ajax Metal Co., Philadelphia, Pa.; Ontario and Western Canada, C. M. Ivey, Empire Mfg. Co., Ltd., London, Ont.; Quebec and Maritime Provinces, Robert Job, Vice-Pres. The Milton Hersey Co., Ltd., Montreal, Que.

A. F. F. Officers.

The Associated Foundry Foremen held the election of officers at their morning session on Thursday, Sept. 26, when the following were appointed:—President, Robert Walker, Port Chester, N. Y.; Vice-President, P. M. Wooden, Columbus, Ind.; Secretary-Treasurer, Robert B. Thompson, Buffalo, N. Y. Mr. Thompson is the retiring president.

Foundry and Machine Exhibition Company.

The annual meeting of this company is held on the last Monday in October, when the election of officers will take place. The present officials are:

President, H. R. Atwater, the Osborn Mfg. Co., Cleveland, Ohio.

Vice-President, R. S. Buch, A. Buch's Son's Co., Elizabethtown, Pa.

Treasurer, J. S. McCormick, J. S. McCormick Co., Pittsburg, Pa.

Secretary, C. E. Hoyt, Lewis Institute, Chicago, Ill.

Directors: Wilfred Lewis, the Tabor Mfg. Co., Philadelphia, Pa.; H. R. Atwater, the Osborne Mfg. Co., Cleveland, Ohio; F. N. Perkins, Arcade Mfg. Co., Freeport, Ill.;E. H. Mumford, Mumford Moulding Machine Co., New York City, N. Y.; A. M. Frauenheim, Herman Pneumatic Machine Co., Zelienpole, Pa.; R. S. Buch, A. Buch's Sons Co., Elizabethtown, Pa.; Edward A. Pridmore, International Moulding Machine Co., Chicago, Ill.; J. W. Campbell, the Cleveland Wire Spring Co., Cleveland, Ohio; and Henry A. Pridmore, of Henry E. Pridmore, Chicago, Ill.

OIL AS A SUBSTITUTE FOR COAL.

THE recent coal strikes in Germany have had the result of intensifying public interest in that country on the question of substitutes for coal. In many industrial works requiring a large amount of coal, says the British Consul-General for Westphalia and the Rhenish Provinces, steam engines have of late years been partly replaced by engines worked with benzol and oils of various kinds. As coals become more expensive, technical improvements in oil engines are being made, which will in time cause the use of coal to decrease. Oils of all kinds, particularly petroleum, says the consul-general, suggest themselves as substitutes for coal. Of late, the Diesel engine has attracted a great amount of attention, and in connection therewith, the improvements in the process of obtaining oils from coal. It is only quite recently that the difficulties experienced with these oils have been overcome. Since the last coal strike, many firms have turned to oil in order to lessen the danger of running short of coal, and many firms have made slight alterations in portions of their furnaces in order to be able to burn oil fuel.

A FOREMAN'S JUDGMENT.

THIS is one aspect of a foreman's character which counts for much in the conduct of a machine tool shop. Judgment he must possess in addition to knowing his work and how to manage men. A well-balanced and ready judgment is an invaluable possession. It begets confidence in him; men are willing to be guided by him, and defer to his decisions, believing that they are on the whole sound and good. Rapidity of decision does not always go hand in hand with good judgment. A man may decide a point quickly because he is hurried and worried and has many other things to consider. Then he may wish he had decided on some other course, and perhaps reverse his previous decision. That is a mistake on the part of a leader. The hesitating man never commands confidence. Confidence in one's own judgment begets confidence in those around. It is much better when a man feels doubtful of a certain course to defer decision if possible till the next day, and bring waking thoughts to bear upon it.

Production Economy.

Among the problems that call for good judgment are, first, those relating to the economies of production. Naturally a man of sound judgment will consider the total economies of a job throughout every process to which it is subject, and bring his brain to bear on the problem of how to carry it out with the best saving on the whole to the firm.

Another matter is the giving out of work. Some man can be trusted better with certain jobs than with others. It is not difficult to settle the choice in the case of old hands, but it becomes so when a fluctuating body of men put on during busy times have to be handled. A good method often in such cases is to put the new men to work along with the old tried hands, who will then become a valuable check on the new men.

Errors In Castings.

A further point may be mentioned here. Errors in castings may not be discovered before the work leaves the pattern shop or the foundry, and are only found out after the castings have got into the machine shop or the turnery. If time presses, a settlement as to the best course to adopt must be arrived at readily. In the pattern shop the foreman would have the matter practically in his own hands, and could have a blunder rectified without much attention being called to it. In the foundry it would probably only mean cutting about the mold, stopping off, or making good with new pattern parts. The bugbear then is, that box bars and lifters often come in the way, and a mould must be broken up, the pattern altered, and the mould made again entirely. In the machine shop, however, the blunder becomes glaring, and is more annoying to the foreman than if it had been detected earlier, and he is expected to be ready of resource in settling how best to get over it with the minimum of loss and delay.

Choice of Machines.

One of the most important sections of the duties of a machine shop foreman is to decide on what machines certain work shall be done. One not infrequently sees jobs put upon machines which could have been done either more economically or more accurately upon others. It may often happen that milling will be preferable to planing or shaping; but it will also sometimes be the case that the latter methods are more economical, and perhaps more accurate. The planing machine is eminently adapted for tooling work in quantity, that is, a long row of similar objects can be bolted to the table of a planing machine much more expeditiously than they could be done singly on a vertical milling machine or on a shaper; still, having a horizontal milling machine, that would often be better than the planer.

Undue Handling of Material.

An important element in economical workshop practice is to avoid undue handling of work. Neither material nor work in progress should be moved or adjusted twice if once will do. Always, if possible, material should be dumped down in the spot where it is to remain. It is a great waste of time to put work down temporarily and then have to move it again. A piece of work should never be set twice on a machine if it can be tooled at one setting. Work should not be shifted from one machine to another if all the tooling can be done economically on one. Re-setting occupies time, and is a cause of inaccuracy. The greater the number of tools, therefore, that can be brought to bear on a job at once, the better. There are, of course, practical limits to the application of this principle. It would in many cases cost more to rig up a machine for performing two or three simultaneous operations than it would to re-set the work. In standard production, however, manufacturers find that it pays to construct special machines solely for the purpose of performing many similar operations at the same time. If balanced with good judgment, the rule should be observed to avoid re-setting as far as practicable and economical.

Thus in the management of both men and of work, the foreman must be ever alert in the exercise of a sound and ripened judgment. These things cannot be taught; they must be acquired in the ever changing conditions which exist in the practice of hundreds of shops. No single shop can give its laws to another, because machine equipments, character and volume of work done, and the class of hands available, are all vital factors. The best foreman is not, therefore, necessarily the best handicraftsman, but the man whose judgment is the most clear and well balanced.—Practical Engineer Supplement.

HORSE-POWER RATING OF MOTOR CARS.

THE report of the Committee in England on the horse-power rating of motor-cars was issued a few days ago by the Treasury. The Committee summarised their recommendations in the form of amended regulations which they think might take the place of the provisional regulations now in force. Some of their draft regulations are the following:—

For the purposes of these, the horse-power of any motor-car deriving its motive power wholly from an internal combustion engine worked by a cylinder or cylinders shall be taken to be:—

(a)—In the case of a single-cylinder engine the horse-power attributable to the cylinder of the engine.

(b)—In the case of an engine having two or more cylinders, the sum of the horse-powers attributable to the separate cylinders.

The horse-power attributable to any cylinder of an internal combustion engine shall be deemed to be equal to the square of the internal diameter of such cylinder measured in inches divided by a numeral:

(a)—In the case of a single acting cylinder having a single piston, the numeral used as divisor shall be 2.5.

(b)—In the case of a single-acting cylinder having two pistons, the numeral used as a divisor shall be 1.6.

The horse-power of any motor-car deriving its power wholly from a steam-engine shall be taken to be proportionate to the effective heating surface of the boiler supplying steam to such engine, at the rate of 1 h.p. for every 3 sq. ft. of such effective heating surface, and the effective heating surface shall be taken to be:

(a)—In the case of a boiler having horizontal or approximately horizontal tubes, the whole of that surface of the tubes which is exposed to the flame or hot gases.

(b)—In the case of a boiler having vertical or approximately vertical tubes, half of that surface of the tubes which is exposed to the flame or hot gases.

Any motor-car deriving its motive power from an electric motor or motors shall be deemed to be of a horse-power exceeding 6½, but not exceeding 12.

TEXTILE MILL DRIVING.

A HIGHLY practical arrangement was made by the Textile Institute for its recent congress. Four authors had been invited to discuss the driving of textile mills from the respective points of view of the steam engine, the Diesel engine, the gas engine, and the electric motor. To enable comparable figures to appear in the papers, the authors had met and agreed upon certain bases of comparison, and the result was a series of entertaining papers.

Mr. J. F. Crowley presented a very good case for electricity. He said that over 7,000 motors had been sold in England for loom driving. The case for electrical driving did not depend merely on a saving in transmission loss. Steadiness of drive and the advantages accruing from the adoption of individual drive were important factors. Then there were flexibility, lighter and cheaper buildings, less floor space, improved lighting, and so forth. It was difficult to convince mill owners that serious fluctuations in speed occur in ordinary mechanical drives. Mr. Woodhouse had made tests on a mule counter-shaft, the mule being the worst offender in the textile mill, which showed that with mechanical drive the maximum speed range was 25 per cent. of the mean speed in the case of mechanical drive. This was reduced to 17 per cent. for an individual D. C. electric motor, and to 6 per cent. for an A. C. motor. The mule in a mechanically operated mill affected the running of every machine connected with the shafting from which the mules were operated. With electrical driving this trouble disappeared.

Constant Speed Desirable.

It was important to remember that constant speed should be maintained during the actual spinning portion of the mule cycle, and that a given variation in speed would be more serious with a grouped drive than for an individual drive, since, in the former case, the speed fluctuations would result from the variation in load of the mule itself, and would, therefore, follow the cycle of operations in the mule. Individually driven mules gave a 5 per cent. increased production over group or mechanically driven machines. For the driving of ring-spinning machines, electricity has peculiar advantages. In the worsted trade, ring v. mule spinning was a matter of argument, but the ring frame had been aided by individual electric drive with automatic speed control, and as much as 18 per cent. in time had been saved by this method against electrical driving alone. A ring doubling frame tested on the Lancashire Electric Power Co.'s mains showed a maximum speed range of 6 per cent. of its mean speed when mechanically driven, and of 0.5 per cent. when electrically driven. By adopting electric driving, loom speeds could be increased. Speed fluctuations grew worse as the distance from the engine increased, and in a Yorkshire mill a 3 per cent. variation in engine speed was magnified to one of 20 per cent. on the line shafting.

Test Data.

Tests taken some time ago to convince a doubting manufacturer of the advantages of electrical driving showed that the loom speeds could be raised 9 per cent. without any increase in breakage, the material improved in quality, and the production increased from 15 to 20 per cent. Increased production was of much importance. From Board of Trade returns he could show that a 10 per cent. increase in production in one case resulted in a 30 per cent. increase in profits. Motors for textile work had to be specially designed. They must be well protected from dust and "fly." Their rating must be liberal, as the load is usually continuous. Their efficiency must be high over a wide range of load. Since the starting torque for loom motors was two and a half times normal and for spinning motors twice normal, the starting torque must be high. Their speed regulation from no load to full load must be small as well as over the usual variations in voltage.

ROPE TRANSMISSION.

IN a paper on "The Transmission of Power by Ropes," read by Mr. Edwin Kenyon before the Canadian Society of Civil Engineers, it was stated that, all things being equal, the durability of cotton ropes may be gauged by sectional area, and the most economical diameters range from 1½ in. to 1¾ in. A remarkable case of longevity has occurred in the case of twenty-four cotton ropes 1¾ in. diameter, employed to transmit 820 horse-power direct from an engine fly-wheel 28 ft. diameter in a Lancashire cotton mill. They were fixed in September, 1878, and have been running from then till now, a period of over thirty three years. The lives of other cotton ropes under similar conditions have extended over periods little short of this, while others fixed from eleven to fifteen years ago and working without cessation, week-ends excepted, are still doing good service. Such longevity leads to the conclusion that "fatigue" due to constant activity does not readily manifest itself in well-made cotton driving ropes. Their quick recovery from driving strain is suggested as the cause, seeing that they pull down on the working side but bulge out to their normal diameter immediately they pass to the trailing or slack side of the pulleys.

CANADIAN TRADE.

CORRECTED customs for the year ending March 31, 1912, show that the aggregate foreign trade of Canada was $847,637,794, made up of exports of $315,317,250, and imports of $559,320,544. The total duty collected was $87,576,036, as compared with $73,312,367 in 1910.

Exports.

The United Kingdom was the best customer of Canada, taking $151,853,413 of her exports. The United States took $120,534,634. Other countries to which Canadian goods were exported were:—West Indies, $6,900,940; South America, $4,825,030; Newfoundland, $4,284,313; Anustralia, $3,947,015; Germany, $3,814,914; Belgium, $3,732,222; France, $2,123,705.

Imports.

Canada bought most heavily from the United States, her imports from that country being $356,354,487; those from Great Britain were $116,907,022, while those from other countries were:—France, $11,744,664; Germany, $11,090,005; South America, $10,533,310; West Indies, $8,490,878; Switzerland, $3,458,006; Belgium, $3,686,419; China and Japan, $3,112,982. Of the duty collected $49,177,584 came from the United States and $22,367,069 from Great Britain. The percentage of duty on all goods imported for cinsumption was 16.

Provincial Record.

The trade was divided among the provinces as follows:—

Province.	Exports.	Imports.
Ontario	$108,554,833	$240,262,151
Quebec	123,104,836	164,349,054
Nova Scotia	23,569,432	19,285,187
New Brunswick	28,979,547	11,953,742
Manitoba	3,302,815	44,223,896
British Columbia	20,272,840	49,345,161
P.E Island	583,211	703,269
Alberta	52,685	13,878,838
Saskatchewan	4,621,809	14,266,969
Yukon Territory	2,275,241	952,669

Customs Revenue.

The Customs revenue was derived from the several provinces as follows:—

Ontario	$34,326,700
Quebec	23,047,221
New Brunswick	1,842,036

Vol. VIII. OCTOBER, 1912 No. 10

A PHASE OF TECHNICAL EDUCATION.

ATTENTION has already been drawn in the editorial columns of this journal to the widespread desire towards, and inauguration of schools or institutes for the dissemination of technical education in leading cities of the Dominion of Canada, and at this particular juncture, we desire to discuss a feature of the situation which, without mincing matters, shows the utter disregard being shown in one or more instances, at least, to the most elementary considerations which nature demands should be fulfilled between a man and his fellowman. We refer to the disposition or attempt to give something for nothing.

Let us say at the outset, that we recognize not only the value, but the need of technical education in this land of possibilities, but in so doing, and with all due respect to the sincerity of purpose, if it exist, of the active agents in the movement, that we are heartily out of sympathy with a system which provides fat salaries, secured by Government subsidy or otherwise, to men who will lend themselves to such a proposition as the levying of nominal fees, baited with the catch-penny return of same on a mere attendance basis. We say without hesitation, and backed by experience, that anything worth having is, in the nature of things, worth paying for, and that a technical education, like everything else, cannot be secured for a trifling two hundred cents or thereby. Much money has been spent in securing data, much is being and will be spent in providing comfortable cribs for administrators, palatial buildings and elaborate equipment, but little thought and still less consideration is being given to the ultimate object or outcome of the scheme. Little if any allowance has been made for the student feature, its disabilities and moral sensibility—the ridiculous, insulting-to-moral-sensibility and "drink, puppy, drink," scale of fees being altogether ample evidence.

The acquirement of a sound technical education is a rational purchase, and should in the first instance be reckoned as such by the sellers. There should be none of the "cheap jewelry" feature, and still less of the "get-rich-quick" methods connected with its get-up. Students of the mechanical arts have just as keen a perception, and are as capable of analyzing "wildcat" schemes of acquiring knowledge as are the most discriminating in other spheres, where men barter for at least one hundred cents to the dollar. Speculation in most cases is disastrous, but even in "mines" has panned out on occasion, satisfactorily. Has speculation, we ask, and we know it has been tried, ever succeeded in the realm of education? With all respect to the enthusrasm of well paid dispensers of knowledge, let us say, and that something more convincing is required to impress both the student and the onlooker, that the sacrifice of the former's time, disregarding the required financial outlay, is worth while. There is an increasingly strong desire abroad to-day to furnish a high class product in every line of manufacture, and much thought and study has been and is being given to its realization in the mechanical arts. Operators have become imbued with the spirit of the movement, and recognize in it the certainty of higher returns to themselves, corresponding to the improved methods of production. The natural line of reasoning they will take in this technical education feature of which we have been speaking, is that little, if anything, is likely to be gained. A youth or man, to-day, finds study hard and irksome, perhaps more so than in any previous epoch, and a stake of two dollars per session will not tend to relieve the difficulties, neither will it make him mourn much, should the burden of acquirement of knowledge prove too heavy to bear.

It has been urged that the "low fee and return" method admits of the opportunity being available to lads earning small salaries, who have aspirations to higher achievement, and whose very youthfulness precludes the possibility of paying more, or indeed, anything, for a considerable time in the immediate future. In such cases, while there may be some semblance of justification, it is overwhelmingly apparent that the tendency will be towards removal of much of the ambition and incentive to overcome such disabilities as that of the cost of educating one's self. Nominal fees, such as are being charged, lead to monster enrollments at session opening. Unfortunately, however, these have never been of even statistical value, much less creditable for a reasonable percentage of individual achievement.

All experience in technical education work goes to show that enrollment by hundreds in all or any subject means at a period long before vacation is reached, reduction to a mere handful. Further, technical schools, no matter how magnificently equippde, and efficiently staffed make no pretence of catering to the abnormal rush to become members of the more familiar mechanical classes. Were they to do so, there is a probability that more "wheat" would be garnered, but it is doubtful if the means would justify the end. Large classes minimize the chances of individual instruction, and most students need the latter to the fullest extent possible. If they don't get it they naturally quit, and more or less discontent, accompanied by unkind but deserved criticism, follows. Instances are on record where, in spite of reasonably high fees, it became necessary, on account of the huge enrollment taxing the college capacity, to double-up the fees, and whether it was complimentary to the value of the instruction being given, or for some other reason, the enrollment suffered little in consequence.

DUPLEX SAFETY TRIPPING DEVICE.

By J. H. R.

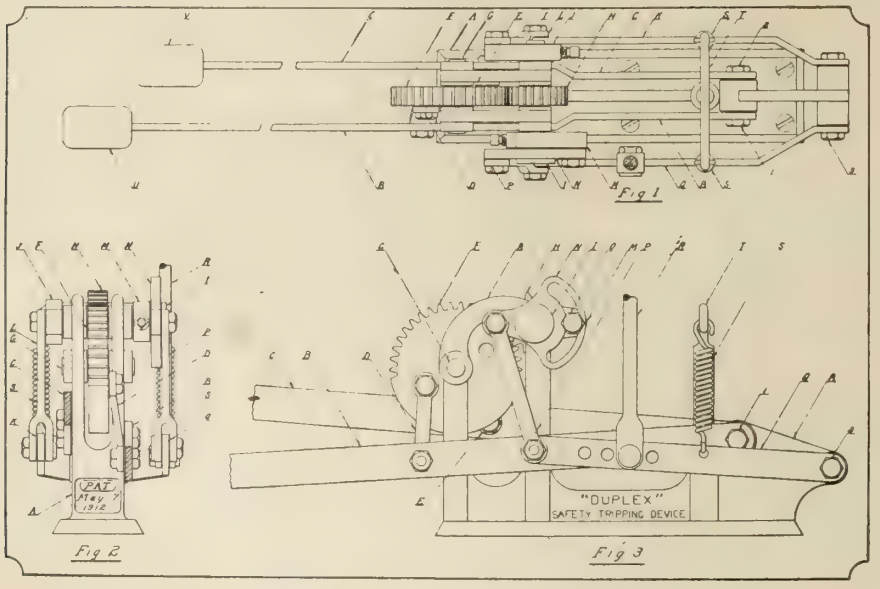
THE origin of a great number of crippled and disabled hands of men employed in the iron or sheet metal working trades, can be traced to the power press, where the starting and stopping depends entirely upon the attendant. The starting of a large percentage of different makes of power presses, is by the depression of a foot treadle below the bed of the machine, thus releasing the latch that holds the clutch out of gear, and allowing the crank-shaft to make a revolution.

Tripping a Power Press.

Immediately the press is in action, the foot must be lifted or removed from the treadle, to allow the latch to return to its former position and prevent the crank-shaft making more than one revolution. In nine cases out of ten, when an accident takes place, the operator will say that the press "repeated." This may, or may not be true; but if the press did repeat, it was due largely, if not entirely, to a lack of caution displayed by the person in charge. When an operator removes his foot from the treadle each time he trips the press, it requires double the number of movements to perform his duties, and where from 10,000 to 30,000 operations a day are performed, it involves considerable muscular action in a person's leg or foot. On the other hand, where an operator does not remove his foot from the treadle, but allows it to return, after releasing the press, he must, to a large extent, retain considerable tension upon the muscles of his limb, in order to prevent the depression of the operating treadle, before the proper time. Now, one not familiar with the operation of power presses, has only to imagine what effect this muscular strain would have on the limb of a person, who is practically holding the weight of his leg up for from seven to ten hours a day. The writer has seen operators rise from their seats, and put their right leg in action, to remove the feeling brought about by the strained position.

Careless Operation.

Another objectionable feature, and well worthy of censure, is the custom of a large number of press operators to allow the treadle to rise in amount just sufficient for the latch to operate the clutch pin. I have stood for considerable periods noting different operators, and quite a number allow only one-eighth of an inch contact, when there should be one-half inch. An observer can readily see that this perilous condition of affairs neither facilitates the operation, nor increases the rapidity of action, but on the contrary, leaves an opening whereby the attendant, when placing work in position, may unintentionally depress his foot sufficiently to trip the press, owing to his carelessness in not allowing the latch to return to its proper position. It is from this source, more than any other that the majority of casualties spring.



DUPLEX SAFETY TRIPPING DEVICE.

Detail of Safety Device.

The accompanying drawings illustrate a "Duplex Safety Tripping Device," built, and patented by Jas. H. Rodgers, and Wm. J. Spence, both of Hamilton, Ont., which reduces to a minimum, the number of accidents traceable to the carelessness of the operator.

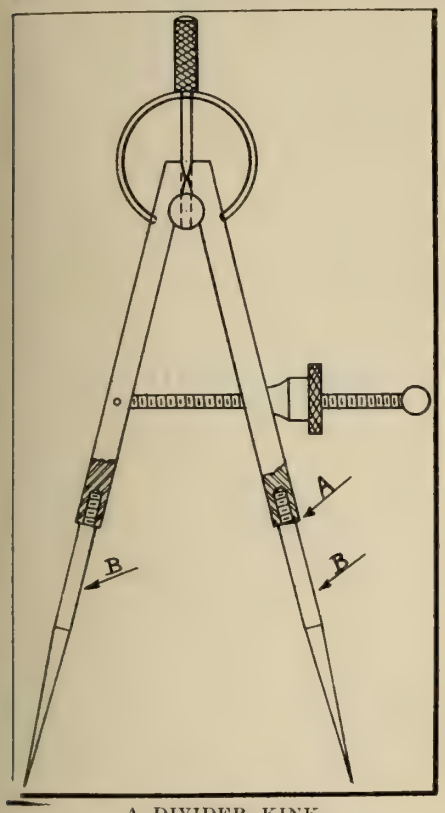
The drawing, Fig. 1, represents a plan; Fig. 2 a front elevation; and Fig. 3; a side view of the attachment. (A) is the frame casting, secured to the floor below the press, on which are mounted the various parts necessary to meet the required results. Fulcrumed at (1) and (2) are the two treadle levers (B) and (C) extending to the front of the machine, in the ordinary manner, and in a convenient position for the operator. The links (D) and (E) connect the treadles (B) and (C), with the gear (F) at diametrically opposed points. The shaft (G), on which gear (F) is secured, rotates through an angle of about 60 degrees. Meshing with gear (F) and secured to shaft (I) is the pinion (H). Secured to the left-hand end of the shaft (I) is the crank (J) which is connected with the lever (K) by the link (L).

On the opposite end of the shaft (I), and secured to it, is another crank (M). Outside of the crank (M), and free to rotate, is the slotted disc (N), held in position by the head on the shaft (I) and the stud (O). The purpose of the slot will be described later. The link (P) connects the disc (N) with the auxiliary treadle lever (Q), which is fulcrumed at (3). The trip rod (R) is secured to the auxiliary treadle lever (Q) in the ordinary manner. The tee post (T) carries the two springs (S) and (S). These springs are for the purpose of making the action of the mechanism positive, after the operator has tripped the press, by releasing the latch.

Detail of Operation.

The foot is placed on the foot rest (V) and pressed downwards, lowering the treadle lever (C), and through the link (E), rotating gear (F) in a clockwise direction, thus causing the pinion (H) and the two cranks (J) and (M) to rotate in the opposite or contrary clockwise direction.

When the crank (M) has rotated through an angle of from 60 to 90 degs., governed by the length of the slot in the disc (N), the stud (O) comes in contact with the end of the said slot, and begins to rotate the disc (N). Through the link (P), auxiliary treadle lever



A DIVIDER KINK.

(Q) and trip rod (R), the latch is released by the continued downward pressure of the operator's foot, and back to position to stop the press after it has made one complete revolution. By lowering the other treadle (A) which by the above action has been raised ready for the next operation, the movement of the mechanism is again performed, but in an opposite direction, and with the same results. Every time either treadle is lowered, the press is released and automatically locked after making one revolution.

As will be seen by a glance at the drawing, the crank (J) and (M) will have passed the centre before the latch releases the clutch, and the spring (S) being under greater tension than the other spring (S), the mechanism will perform the movement independent of the operator. The muscular tension on an attendant's limb will, therefore, be reduced to a minimum, as he can allow the whole weight of his leg to go to the floor with the treadle, and remain until ready for the next operation.

The Canadian-Cleveland Drill Co. is now located at 80 Duchess Street, Toronto; their previous address having been 24 Adelaide Street W.

A DIVIDER KINK.

By E. W. Tate.

ILLUSTRATED herewith is a method used in our shop by the foreman of the drills in order to economize in dividers. Taking his old dividers, the points of which had become badly worn, he cut them off at (A). After purchasing two scriber points, the legs of the dividers were drilled and tapped to receive the points (B), and the instrument was thus made as good as new.

A MILLING AND DRILLING JIG.

By D. O. Barrett.

THE piece shown in Fig. 1 is a forked post supporting one of the levers on a gas engine. The lever is carried between the surfaces (b) and (c) by means of a case-hardened steel pin. The post rests upon the frame of the engine on surface (e) and is held by two ⅜ inch cap screws through the 13-32 inch drilled holes. In machining the piece, the first operation is to mill the surfaces (e). This is done by clamping the two bosses in a vise, with the tops resting on the bottom of the vise. The cutter is set to the correct height and the pieces can thus be duplicated. Clamping in the vise was found to be much simpler and fully as fast as if a special jig had been used.

Fig. 2 shows the jig for milling the surfaces (a), (b), (c) and (d). The body (A) of the jig is tongued to suit the grooves in the miller table and has

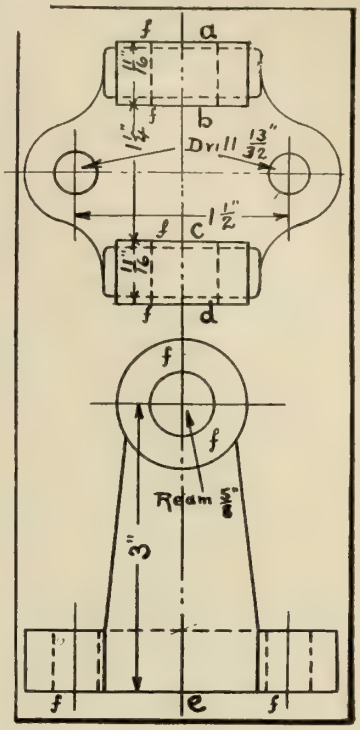


FIG. 1. MILLING AND DRILLING JIG.

an upright post at each integral with it. A steel vee-block (W) is held to the body by means of cap screws and dowel pins, while another vee-block (V) slides

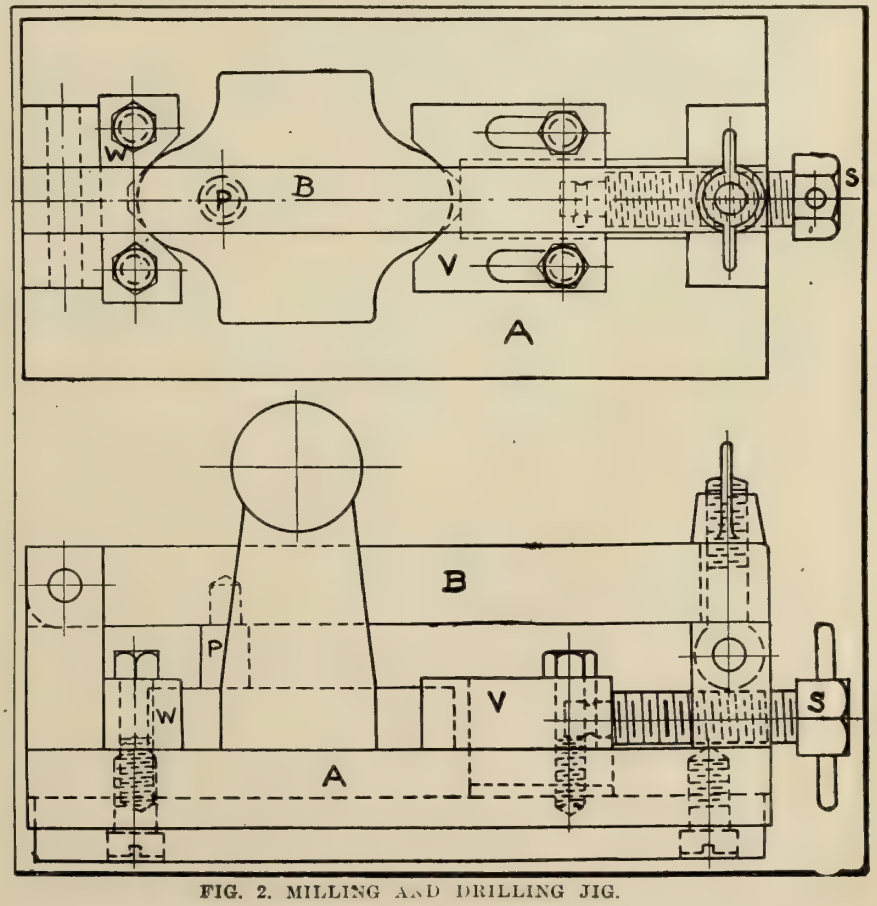

FIG. 2. MILLING AND DRILLING JIG.

in a groove in the body (A); being pushed forward or withdrawn by the screw (S). The bar (B) carries the pin (P) which rests on the forward end of the casting, pressing same firmly to the body. One end is hinged, the other being slotted for the swinging screw and thumbnut. The piece to be milled is set so that one end engages with the forward vee-block, the rear block being then tightened up by the screw (S). The bar (B) is next brought down and locked with the thumbnut.

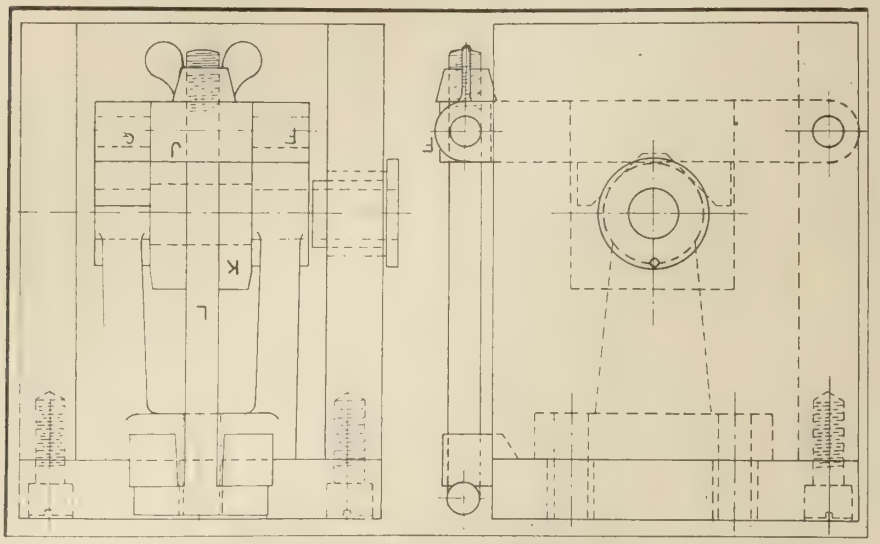

FIG. 3. MILLING AND DRILLING JIG.

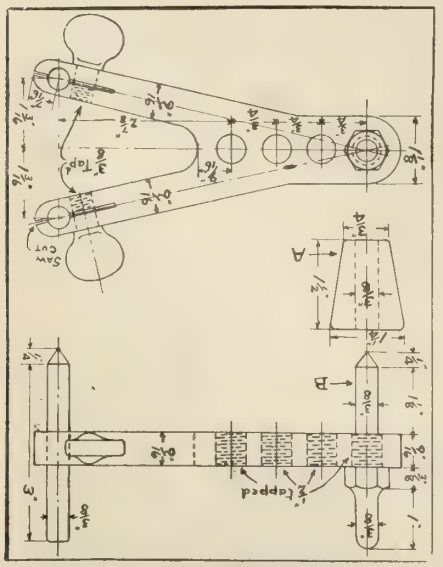
It was at first thought that the force required to feed the piece through the cutters would injure the screw (S); but the bar (B) had sufficient clamping effect and no trouble was experienced. One bad feature about the jig as shown is that the slots for the cap screws in



TOOL FOR LAYING OFF BOILER PATCH BOLT HOLES.

block (V) rapidly fill with chips, but this difficulty may be easily overcome by covering the slots with strips of sheet metal punched to take the cap screws.

After milling, the holes are drilled and reamed in the jig shown in Fig. 3. This is essentially a box with the front side and bottom removed. In order to machine the inner surface of the top, the latter was made a separate piece and then dowelled. In the top are two bushings for the 13-32 inch drilled holes, and in the side is the removable bushing for drilling and reaming the ⅝ inch hole. This bushing is prevented from rotating by means of a short pin which fits into a hole in the jig body. The bars (F) and (G) are separated by the block (K), which is about 0.005-inch less than 1¼ inches. Bar (G) is provided at the centre with a V which locates the piece to be drilled. Bar (F) is flat, in order to allow movement sideways, if necessary. The steel piece (J) is loosely fitted between the two bars to allow a slight relative movement in case the two bosses are not quite the same height. The block (K) is held to the bar (G) by screws. The T-headed bolt with thumbnut pulls down the casting against the finished inner surface of the top of the jig.

In placing the pieces in the jig, it is of course necessary to turn the latter over and drop the work in. The block (K), being bevelled, drops between the two finished surfaces and maintains the alignment sideways, while the vee on bar (G) locates the piece at right angles to this.

TOOL FOR LAYING OFF BOILER PATCH BOLT HOLES.

By J. J. Smith.

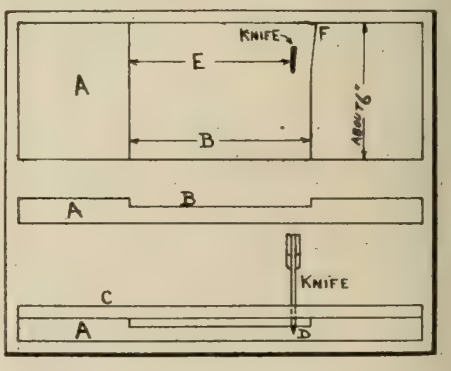
THE device here shown is a very handy tool for laying out patch bolt holes in locomotive boilers, or in fact any type of boiler. When the old patch bolts or rivets have been removed, the taper plug (A) is slipped over the pin punch (B) and the whole arrangement placed against the boiler plate, with the taper plug (A) in one of the holes. The two back punches are then adjusted by the thumb screws until the body of the tool is parallel with the boiler plate. These punches are next tapped lightly with a hand hammer, two identification marks being thus made from which a new patch can be marked. When each rivet hole has been marked in this way, the new patch is applied and the centres for the holes are readily marked by the punch B, being accurately located in setting the two back punches to the identification marks.

It will be seen that an error is almost impossible with this device. Moreover, it can be used for any number of holes in a patch, provided the original plate of the boiler can be reached by the two back points of the device. Extra tapped holes, into which the front point (B) can be screwed, are provided for use when desirable; as for instance, in locating two rows of bolts or rivets close together.

CUTTING DOWN BELTS.

By Retals.

IF you have a belt which is too wide, and you wish to reduce the width by ½ inch or so, take a short piece of board (A), not more than 6 inches wide, and across the grain, cut a groove (B), of the same width as the belt about to be cut. The depth of this groove should be a trifle greater than the thickness of the belt. Next nail across the top a second board (C), of the same length and width, but only about ½ inch thick. Sink your pocket-knife blade down through the top board and far enough



CUTTING DOWN BELTS.

into the lower board to support the blade against the force of the cut, as shown at (D). As a knife blade tapers more or less from front to back, set the blade so that the space at (E) will be parallel. Cut away a clearance at (F) to allow for the taper of knife blade

and also to allow the strip of leather that is cut off to escape easily.

With a sharp knife, this makes an excellent job. The belt has to follow the groove; it cannot get away and will be of even width throughout, no matter what the length. This rig is cheap and safe and can be readily made up in 15 minutes. Start the belt through and if no one is neary-by to give a pull, grip one end in a vise and walk away from it.

HYDRAULIC RIVETING OF BOILER HEADS.

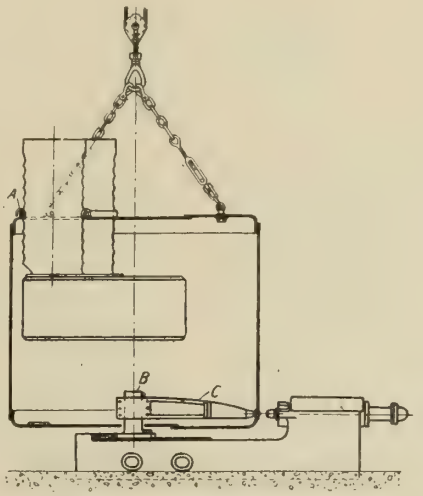
THE desirability of riveting by power all the seams of boiler shells is widely admitted. In practice, however, such a proceeding, although sometimes carried out, necessarily affects to some disadvantage, the disposition of one at least of the two flanged head-plates. It is usually possible to rivet hydraulically the circumferential joint at one head of a boiler, and to do so with the flange of the head-plate pointing within the boiler. The riveting-in of the other head-plate has, however, to be done under different conditions, for the first head being now closed, it is impossible to get the limb of an ordinary riveting machine within the boiler shell. If hydraulic riveting should be insisted upon throughout, there is ordinarily no other alternative than the reversal of the head-plate and its disposition with the flange pointing outwards.

Disadvantage of Outward Flanging.

This arrangement of the second head-plate is undesirable for at least three reasons. In the first place, the space formed between the fillet of the flange and the cylindrical shell is found to gather sediment and to be subject to excessive corrosion. Secondly, for the same internal capacity, the length of the boiler overall is increased by an amount equal to the depth of the flange. Thirdly, the reversal of the head-plate does away with one of the two caulking edges. The caulking, in fact, has to be confined to the external seam, for there is now no suitable edge in the interior. These facts are of sufficient importance in many cases to weigh down the advantages obtained from the hydraulic riveting of the second flange, and in practice it is usual to revert to hand riveting for this seam, and to arrange its flange pointing inwards like the other.

New Type Riveter.

When in Dundee, recently, says "The Engineer," a representative of this journal was shown a new system of boiler riveting at the engine works of the Caledon Shipbuilding and Engineering Co. This system is in accordance with the ideas of Mr. Thompson, sen., and the machine used in it has been designed and constructed by the company. The accompanying cut clearly illustrates the essential details of the method. In this case a single-ended boiler is being dealt with, and here the first steps are the riveting-in of the furnace door head-plate by the usual means and the complete assemblage and riveting of the furnace flues and combustion chambers. The flues and their chambers are placed in the interior of the shell and passed upwards until about half the length of the flues project through their flanged holes in the head-plate. They are supported in this position by means of bent clips engaging over the flangers and within the flue corrugations as shown at A. The rear head-plate is provided with a central hole, and is disposed horizontally on



HYDRAULIC RIVETING OF BOILER HEADS.

the special riveting machine with its flange pointing upwards. The post B of the riveting machine passes through the central hole, and to it there is attached an arm C carrying the holding-up rivet die.

The boiler shell is now dropped over the rear head-plate thus arranged, and riveting proceeded with in the obvious way. The withdrawal of the arm C, after operations are completed, is effected through the hole in the head-plate. This hole is finally closed up with a patch. The post B is adjustable lengthwise on the bed of the machine, and the arm C can be lengthened or shortened so as to permit various diameters of boilers to be dealt with. The machine we are informed, has given every satisfaction since its installation. It is, of course, equally applicable to double-ended as to single-ended boilers.

FALLACIES ABOUT CYLINDRICAL GRINDING.

ONE popular notion credits some particular virtue to a grinding machine because the work table traverses, and another that machines on the market where the wheel traverses instead of the work, have again some particular virtue in this respect over the former.

Now, it does not make, in my opinion, one particle of difference whether the work traverses by the wheel or the wheel traverses by the work, so long as other things are equal. If the designer in either case has hit upon a plan for the various mechanisms in connection with the machine, whereby he gets accuracy, whereby he is assured of accurate diameters at the will of the operator, and does get accurate work upon the machine, it makes absolutely no difference whether the wheel traverses or whether the work traverses. We believe that we have selected mechanism of such a nature as to secure accuracy of diameter at the will of the operator and that we could not have selected this mechanism if we had been obliged to do so with the wheel traversing.

This is a matter of design, and it is, in my opinion, a sign of ignorance on the part of any mechanic to advocate either method of traverse as being better than the other. If, in his criticism of one or the other, he shall point out some defect in the design or arrangement of the parts whereby accuracy can or cannot be secured, there will be some intelligence in his conversation; but if he points out that one machine must be superior to the other because the table does not move by the wheel or because the wheel does not move by the work, in my opinion, it is a sign of ignorance of the question. It is well for us, therefore, not to be too cock-sure which machine is the best until we know all about both.

Another popular fallacy is that in order to secure a wheel to grind fine surfaces, the wheel must necessarily be of fine grain. This is a common mistake, and leads to a great deal of misunderstanding. It is also a mistaken notion that it is economy to avoid trueing the wheel. On the other hand it is real economy to true the wheel perfectly and often. Of course, we are referring now to cylindrical grinding, and in any talk of this kind it is well to understand the difference which may exist between cylindrical grinding and any other kind.

There is another popular fallacy that work should be turned very close to size in order to grind. It is assumed that the grinding machine can remove only a small portion of metal and the believers continue to make the mistake of spending valuable time and money in turning work accurately on an engine lathe. The facts are, that the present

day grinding machine is so designed, with sufficient power, rigidity and accuracy, that the work need not be turned accurately, and the turning machine to-day is merely a roughing tool in fact. It remains simply for the public to come to the understanding of the fact that the grinding machine makes entirely unnecessary, accurate turning, and thereby is in a position to decrease the cost of producing ground work and at the same time give accuracy.—C. H. Norton in "Grits and Grinds."

THE NARROW GUIDE ON MACHINE TOOLS.

By Alfred Wildgoose,
in "Practical Engineer."

ANY attempt at modification or alteration in the design of a machine, whether it be a machine tool or otherwise, which will make for improvement either in working efficiency, ease of manipulation, or utility, or which will reduce the cost of the machine or article produced by that machine, should be encouraged. The prevailing eagerness exhibited in this connection as exemplified by the innovation frequently presented in new designs or re-designed tools occasionally results in the adoption of an idea which savours more of a selling or talking point rather than of a decided improvement. In the opinion of some, this might be said of the narrow guide, as introduced and boomed in machine tool design some years ago. In contemplating or deciding on a new departure one would assume that experience had shown the necessity and desirability of some alteration. At times, however, improvements suggest themselves spontaneously, and ultimately prove to be of real value, although their necessity has not actually revealed itself or been apparent in actual working. The latter remark might possibly apply to the narrow guide.

At the present time there are thousands of lathes and other tools in operation with guiding surfaces for the movable slide, of the ordinary and well established form. In adopting the newer and questionable type of narrow guide it is a question whether the relative efficiencies and strengths of the two forms were carefully investigated, and it is a further question whether this investigation did prove detrimental or prejudicial to the older type. I do not remember having seen the results of any experiments proving the superiority of the narrow or the inferiority of the other design of guiding ways.

Comparative Results.

Examining the many designs now available, no definite idea can be gathered as to what is supposed to constitute a narrow guide. A careful study would indicate that many of the firms who have adopted the principle are not quite convinced as to the advantage of presenting us with a narrow strip of metal largely lacking in strength and stability. Further, if the principle is good, and better than the old-established one, why is its application limited in the majority of cases to the main carriage or sliding unit? Surely if it is such a boon it might be worthy of adoption in the several parts usually embodied in a machine tool, where the conditions of working are much the same. At least, those makers who adhere to the more conventional view are more consistent in its application. In the absence of a more general use of the principle respecting any particular tool, the conclusion naturally arrived at is that it is either more costly, less convenient or lacking in other respects. Experience with both designs fails to show an appreciable advantage in any respect with the newer type, while many of the applications exhibit several bad features.

There are at the present time many lathes and other tools of the ordinary type whose ease of manipulation it would almost seem impossible to improve, and whose efficiency could hardly be surpassed. They have been in constant operation for twenty years, and in some cases more, with a minimum of attention, and still produce excellent work. In face of this, it appears almost idle to transfer our favors from a design having claims of so justifiable a character to one which at best is in the nature of an experiment, having yet to prove the justification for its existence. It has been suggested that the new design was called for by the introduction of high-speed steel, and, although many improvements with respect to general rigidity were necessary, surely the subject under discussion cannot be conceded to be one of them. Instead of increasing the stability several of the types present an inherent weakness.

True there are tools by undoubtedly good firms on which the narrow guide is embodied which have proved themselves to be machines of high value in many respects, and in the general all-round satisfaction given by these tools due to various modifications and improvements the narrow guide might be unconsciously thought to have contributed thereto. Yet, in all probability, the original form would have shown itself of equal value, and very likely in the course of time been more appreciated.

Infancy of Narrow Guide.

This, of course, remains to be proved, for after all the narrow guide is, comparatively speaking, still in its infancy, while its predecessor has not only stood the test of time, but has stood it well. If at the end of a similar period the new departure should come out with equal honors, then the justification for its introduction and existence will be established, but it is the writer's opinion that such cannot be said at the present time. The position might be discussed from the theoretical point of view, which, as a matter of fact, has already been done with varied results, but in any case the best test is the practical one, for there are conditions which occur in actual working which might not be taken into account or might even be ignored when treating the subject theoretically. Can it be shown conclusively by practical experience or unbiased experiment dealing with all points that the narrow guide is superior? So far as I am aware this has not been done. If it can, then it should be adopted universally, but the writer up to the present is content to favor the perhaps old-fashioned, but still highly satisfactory, arrangement. The opinion of other readers on this point would be of undoubted value to the machine tool industry.

ANALYSIS OF BROKEN RAILS.

AN engineer of the New York Central and Hudson River Railway has analysed 229 broken rails on a main line, the great majority being on high-speed lines and on the near side. There were more breakages on straights than on curves; 184 were of the comparatively recent 100 lb. rail and 45 of the older 80 lb. section; 17 were caused by defects in the equipment, 149 by flaws, and 53 by unknown causes; 240 partial fractures were divided almost equally between fast passenger lines and slow goods lines. The breakages were also equally divided between the heavy and lighter rails. On the former, of the 45 base fractures — principally half-moon pieces out of the base—34 were over the ties; and of the 26 similar failures in the lighter road 17 were over the ties.

The cause of this large percentage where the metals are supported is attributed to the material not being strong enough; to the section not being big enough; or to the stress being too great under the conditions of the support on the tie to which the rail is exposed. Of all the fractures, whether partial or complete, only two were discovered by outsiders, while 298 were found by the company's men, and 169 of the complete fractures were notified by the breakage of the line circuit.

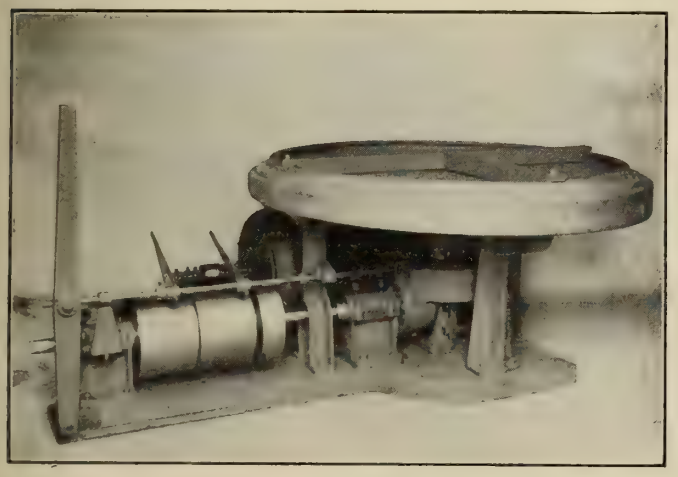
Veritys, Ltd., London, Eng., are sending out List No. X159. This deals with the firm's line of portable electric drills, suited for continuous service.

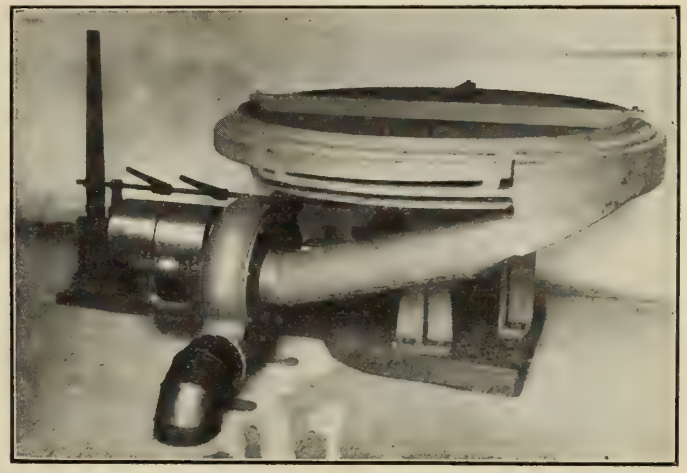
DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

VERTICAL SPINDLE GRINDER FOR JOINTING AND FLATTING.

ILLUSTRATIONS show the No. 19, 53 inch. vertical spindle disc grinder manufactured by Charles H. Besly & Co., Chicago. This machine is for jointing or flatting such work as stove doors, foundry flasks, meter cases, large gear cases, split shafting bearings, etc., where it is not necessary to grind to size or any given angle. The work is laid on the horizontal disc wheel and ground by gravity feed. Where work is too light to grind satisfactorily of its own weight, the practice is to lay on weights. Usually, a large number of pieces (as many as size of disc wheel will accommodate) are ground simultaneously. As soon as one piece is finished it is taken off the wheel and immediately replaced by a rough piece. In this way the disc wheel is loaded practically to its limit at all times. In jointing castings for split shaft bearings, as many as thirty-five castings are grinding at once, a laborer being employed to put the work on and take it off the grinder.





VERTICAL SPINDLE GRINDER FOR JOINTING AND FLATTING.

Constructional Features.

An exhaust ring, cast hollow and slotted for exhausting the grinding dust, extends around the outer edge of disc wheel. This exhaust ring tapers from nothing to about five inches by five inches at the point where exhauster is connected, in order to give uniform suction all around the disc wheel. A removable guard ring, cast in sections, is provided around the disc wheel, projecting 2 inches above the grinding face. This prevents the work flying off the disc wheel while being ground, and aids in properly exhausting the grindings. Suitable wooden bars, as shown, are usually secured to this guard ring to prevent the work revolving with the grinding wheel. A section of the exhaust ring, 26 inches wide, is removable, so that free access may be had to the edge of the disc wheel at this point, for grinding work which may have bosses or lugs projecting beyond the plane of the ground surface. This feature is very desirable, especially on stove work.

The disc wheel, of wrought steel, 53 inches diameter by 1¼ inches thick, is machined on both sides so that both faces of wheel may be set up with circles. When the circle on one face is worn out, the disc wheel may be turned over and the opposite circle used. The machine is usually furnished with a spare steel disc wheel, and a suitable press is also furnished so that one wheel may be set up while the other is in use on the grinder. In this way the grinder may be operated continuously. This is a great advantage over the old style vertical spindle grinders equipped with only one wheel, for when the disc wheel must be set up while in place in the grinder, the latter is necessarily idle several hours each time a circle wears out.

The disc wheels weigh 800 pounds each. For convenience in handling they are drilled and tapped to receive eye bolts for connecting to crane or hoist hook. The grinder and press are usually served by a chain hoist suspended from a suitable trolley. Bevel gears are fully enclosed in a cast iron gear case and run immersed in oil. All bearings are bushed. The horizontal shaft carries tight and loose pulleys, 12 inches diameter for an 8 inch belt. A countershaft is not necessary as the machine may be driven direct from line shaft or motor, above or below. A suitable pulley for driving the exhauster may be mounted on horizontal shaft as shown in illustration.

The grinder is 34 inches high and weighs complete with two disc wheels and press, 6,000 pounds. On work for which it is adapted, this grinder is a real cost reducer as will be noted by the following examples.

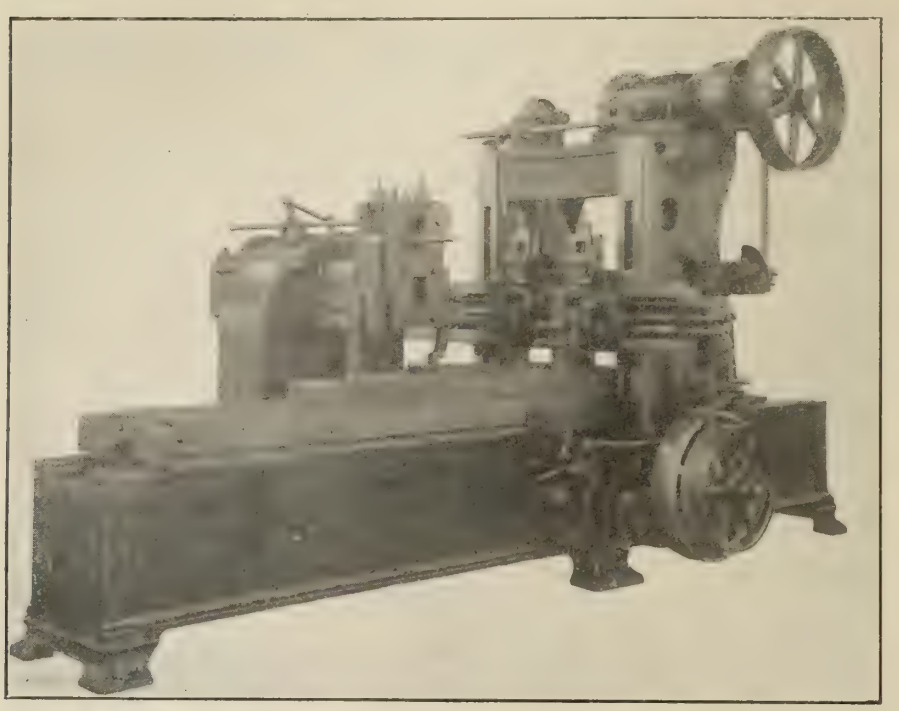
On jointing cast iron split shaft bearings, it is claimed that No. 19, 58 inch Besly grinder does the work six times faster than formerly, where one man operated two milling machines. For facing narrow ribs on cast iron boxes, so large that a 53 inch disc wheel accommodates only four boxes at a time, this grinder, it is claimed, does the work twenty times faster than former profiling process. Again, for facing spots on power pump bed plate castings, 33 inches by 38 inches, weighing 115 pounds, ten times faster than former planing process is claimed.

SPECIAL PLANER ARRANGEMENT.

OUR illustration and description refers to a 28x8 Planer built by the Rockford Machine Tool Co., Rockford, Ill., and equipped with a special housing carrying two toolholders.

The machine was designed to plane bases for a well known line of upright drill presses, and is equipped with the

Rockford standard four-speed drive, giving four cutting speeds with a constant return, same being arranged for belt drive direct from the line shaft, thus eliminating the usual countershaft. The special heads are mounted on a ram of square construction, and the feeds are driven from a friction at the rear of the machine mounted on the intermediate shaft of the planer. The feeds are operated and reversed by the trigger gear shown on the front of the head, within easy reach of the attendant.



SPECIAL PLANER ARRANGEMENT.

The operations of this equipment are very simple. The flat T slotted base is planed and finished with the two heads on the regular cross rail. While this is being done, the rear head on the special attachment machines the top of the hub for supporting the drill press column and the front head planes the pad for the outer bracket at the rear end of the base. We understand that the machine is handling the particular job for which it was designed in a very satisfactory manner and in one-half the time previously required for doing the same work on a similar machine, but without the special-attachment, which, of course, necessitates taking the cuts on three levels at different settings.

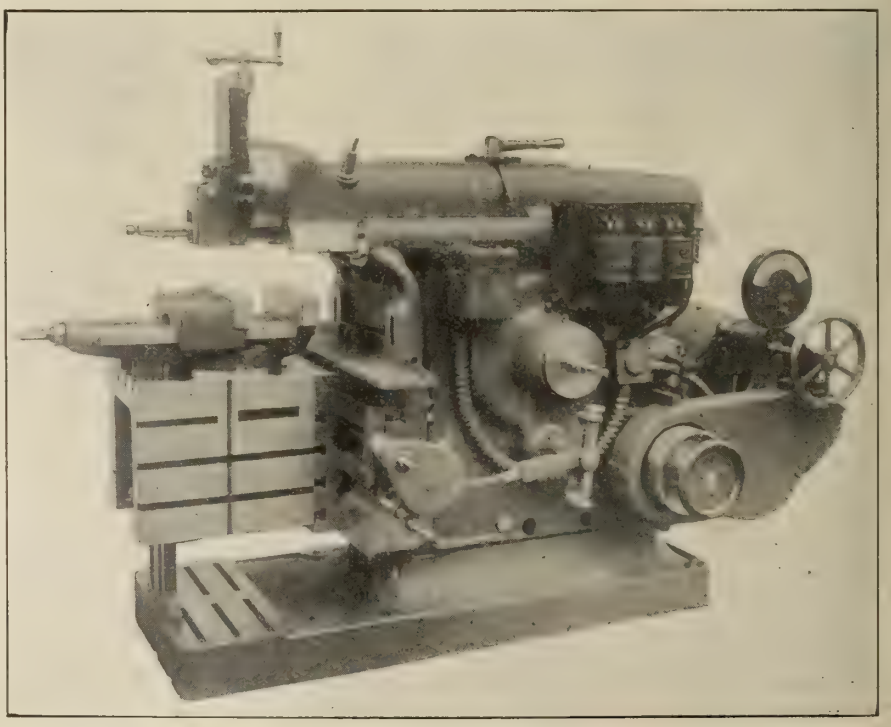
NEW TYPE HIGH DUTY SHAPER.

IN the further development of Gould & Eberhardt's line of "High Duty" shapers, and in response to the demand for designing machine tools for the more modern uses of high speed steel, in steel mills, railroad shops and drop forging shops, this company of Newark, New Jersey, has recently designed and have under construction a number of new "Invincible Type" 24 inch shapers as shown in the illustration. These machines will have a great advantage over previous designs, owing to the new patented construction for raising up the main bull gear, which greatly increases the shaper's mechanical efficiency. In addition to this new feature, there will be found the following improvements:—Outside diameter of bull gear hub increased from 3¾ to 6 inches; larger V bearings and gib arranged so that there is a solid metal to metal construction on each side of ram bearing: solid top main lever; hole being provided in frame for key-seating; shafting overhang of crank pin reduced to a minimum; crank pin thrust taken by solid walls in bull gear similar to ways of ram, no straps or bolts being necessary; patent "Double Train Gear Drive" ratio increased; new front table support of heavier construction; and the head, ram and frame made of more massive construction.

The bull gear hub centre has been raised up nearer the ram 4¼ inches from its present position in the standard 24 inch shaper. Not having changed the position of the fulcrum of the lever, this means that the work arm of the main lever has been lengthened in relation to the load arm, which greatly increases the mechanical efficiency of this reciprocating lever that imparts the power to the ram through the crank pin located on main bull gear. Due to this change in position of the bull gear hub centre, it was necessary to reconstruct the bull gear, which construction, we understand, is entirely covered with patents that have been allowed.

This machine weighs 4,800 lbs., and our illustration shows it direct connected to a "Reliance" variable speed motor, having automatic starter and dynamic brake control.



NEW TYPE HIGH DUTY SHAPER.

A METHOD OF CASE-HARDENING.

CASE-HARDENING is an art of many tips and methods. Even in large workshops it is far from having reached the status of an exact practice, and in smaller places, or with irregular quantities going through, it is often poorly done. In many instances where it could be applied with advantage, it is neglected. A maker's catalogue on the subject arrested attention, and a careful reading proved it to be quite a treatise—very clearly written, with good working rules, and some homely, forcible advice to working mechanics. One of many satisfactory features of this little publication is the absence of any pretence that buying the makers' goods in preference to others will solve all troubles. On the contrary, you are very candidly told that, in addition to good material and a good method, you must apply carefulness and intelligent observation, and acquire skill in the art before good results can be expected. The following condensed reprint is well worth reading. Those practically interested should, however, send for the full pamphlet:—

Case-Hardening Materials.

The very best results in case-hardening can only be obtained by an apparatus which will ensure a uniform heat. There seems to be a general opinion that different qualities of case-hardening materials are necessary for different kinds of work, but experience of over twenty-five years shows that hydro-carbonated bone black is best suited for all classes of work, except where the merest surface case is desired and uniformity is of no material value, and then a common bone meal of the cheapest quality may be used.

Granulated raw bone is still used in some few places, but it is not economical. Carbon is the essential property necessary, and where raw bone is used, the process will not commence until it is converted into charred bone, otherwise known as bone-black or animal charcoal. In converting raw bone into bone-black there is a loss of slightly over one-third in weight, consequently you must add one-third to the original cost; the cost of fuel in charring; the time, etc., to the fire cost of raw bone in comparing it with a bone-black.

The ordinary forms of bone-black are not very extensively used owing to the fact that bone-black absorbs moisture very largely from the atmosphere, and moisture is very detrimental to the best results in case-hardening. The percentage of moisture absorbed depends very largely on the age of the black, humidity of the atmosphere, and other causes which make ordinary bone-black a very un-uniform material and the results correspondingly un-uniform.

Burnt leather is used somewhat, but is very troublesome and quite expensive when cost of preparing is taken into consideration. Of all forms of burnt leather, old shoes undoubtedly give the best results as to color. Care should be taken in using old shoes that metallic nails are not in the charred leather, as they will adhere to the work, and sometimes become so hard as to be removed only with the greatest difficulty. Leather, like ordinary bone-black, must necessarily lack uniformity, as it is waste. The material used should be as free as possible from soft dust, and the grains should be hard and firm, and under all circumstances the bone should be free from slate, slate being the result of over-charring.

Case-Hardening Method.

A method of case-hardening which gives first-rate results for hard surfaces is:—Pack the pieces in wrought iron boxes; for small work, say screws ¼ in. to ¾ in., or smaller size pieces, use a box 4 in. long, 4 in. wide, and 8 in. deep. Put a layer of H.C. bone-black in the bottom, then a layer of the pieces to be hardened, and repeat until the box is filled to about 2 in. from the top. The remaining space can be filled with black that has been used, providing it is free from moisture. Then put on the covers and lute with clay. It is necessary that the boxes should have some little vent in order that the excess of gases caused by expansion should escape. The clay will dry and crack, and permit this vent. In packing, be certain that none of the pieces come nearer to the sides of the boxes than ½ in. In packing pieces with irregular surfaces, such as screws, or with interior surfaces, such as the threads of nuts, the bone-black should be tamped into the crevices but only lightly and not too tight.

The boxes should then be placed in a suitable furnace, or on a cricket, so as to permit a uniform circulating heat on all sides. The heat should be gradually raised to a cherry-red, and retained at that as nearly uniform as possible for three houre or upwards, according to the size of the pieces and the depth of case desired. As the bone possesses the case-hardening power, the larger the pieces and the deeper the case, the greater the quantity of bone and the longer the heat necessary. For pieces 4 in. to 6 in. diameter, the work should be packed in the H.C. bone-black, permitting at least 2 in. to surround each piece, the heat should be raised to a bright orange, and kept at that temperature for three to five hours. The time allowed depends upon the depth of case required and the grade of iron or steel used. Steel can be hardened the same as ordinary iron, but the time and quantity of bone used must be about one-quarter greater to obtain the same results.

The pieces, when ready to remove from the boxes, should be immediately dumped into clear, cold water, salt water being preferable for the larger pieces, because giving the hardest case. It is best to dump the entire contents of the box into the bath, holding the boxes as close to the surface of the water as possible, so as to prevent the air from striking the pieces. If the air does strike the pieces they will assume a black or blue-black color, so that when a bright surface is desired, it is necessary that no air shall strike the pieces. This process of preventing the air from striking the pieces is one requiring the nicest care, and no one can expect to do it properly without practice. A sieve placed about half-way down in the bath will permit the bone to separate from the pieces. The bath should be either large enough to guarantee the coldest possible water, or else so arranged that constant running water is obtained. In cases where special work was being turned out in warm weather, ice has been introduced in order to obtain a low temperature.

Colouring.

Good colors can only be obtained on nicely polished, clean pieces. Badly finished, oily work cannot be colored properly. For colors, pack the pieces as described before, except that nothing but fresh H.C. bone-black should be used. The boxes should be placed in the furnace as before described, and the heat gradually raised to a cherry red, and retained at that temperature for three to four hours. If the heat is too intense there will be no color. The time can be increased or diminished according to the size of the pieces, and can only be determined by experience, the time given being for pieces about the size of ¾ in. screws. In the bath for colors, soft water is preferable. Running water should be used, the inlet about half way down and the outlet 4 in. from the bottom. The water must be kept as cool as possible.

If ordinary streaked black or blue work is desired, the pieces should be dropped into the water at a distance of from 1 ft. to 5 ft. above the surface of the water, the distance being according to the color desired, and ascertained with a little experience. For bright colored work, connect an air pump with your supply pipe, so that when the pump is in operation, the air and water mix as they come into the bath together. When dumping, hold the box as close to the surface as possible, so as to permit no air to strike the pieces. When the pieces are dumped, have a stream of air and water running into the tank. Increasing and diminishing the volume of air gives different effects. As the work comes

from the boxes free from the bone, the pieces should be thoroughly rinsed in fresh water, wiped perfectly dry, and then slushed with oil. Rolling in sawdust is a good method of drying.

Annealing.

The process of annealing is simpler and less difficult than that of case-hardening. It requires less hardening power from the bone, and consequently the waste or used bone from case-hardening can be used in this process. In fact, the H. C. bone-black can be repeatedly used again and again, adding each time a little waste that has not been used more than once. The pieces should be packed in boxes, the same as for case-hardening, excepting that it is not necessary to use such care in keeping them thoroughly apart. The boxes should be placed on the oven and heated through to a cherry-red. Remove the boxes without permitting them to remain too long in the ovens, and cover with ashes, charcoal or waste bone-black until they are cold. Under no circumstances should the pieces be removed from the boxes until they are thoroughly cooled. This process is for a soft anneal.

Owing to the various methods of case-hardening, the different results desired and the difference in the metal, no one set of rules can be formulated that will meet all requirements. Experience must guide the operator to a great extent. If the pieces do not harden sufficiently at one operation, they should be repacked and hardened again in precisely the same manner as at first, and there is no limit to the number of times the operation can be repeated.—From a pamphlet on "Case-Hardening," issued by W. H. Pelfryman & Co., Liverpool, manufacturers of Hydro-Carbonated bone-black.

SMOKE PRECIPITATION BY ELECTRICITY.

A DEVELOPMENT is being made in the United States of a process for electrically precipitating the suspended matter from smelter smoke and fumes, and the dust from rotary kilns in cement works. The general principle is not new, and has been applied successfully in laboratory work by different investigators. The first experiment on a working scale was at the Hercules powder works, where sulphuric acid separated as a dense white cloud of suspended particles. Being so fine it was extremely difficult to remove by filtration, but was easily precipitated by electric current. It was next tried in treating the mists escaping from boiling sulphuric acid used to dissolve silver. At the Balakala works, the gases from pyrites-roasters and matte-roasters are treated at the rate of 250,000 cubic feet of gas per minute. The material is a mixture of solid dust and fume, with liquid sulphuric acid and the gases are highly charged with water vapor, which dilutes the acid and produces a muddy deposit. The gases are treated in flues of sheet lead.

The plant of the Riverside Portland Cement Co., was made the basis of great complaints by fruit growers on account of the fine dust thrown out by the rotary kilns and carried to great distances over the orchards. A plant was installed to treat the product of one kiln—50,000 cubic feet of gas per minute—and the results were so satisfactory that the other nine kilns have been equipped in the same way. The process now being applied also to the removal of dust from blast-furnace gas and producer gas, was developed in the chemistry department of the University of California by Mr. F. G. Cottrell, but the university could not undertake its commercial exploitation, therefore, a special board or "corporation" has been organized to do this. This board will operate like any business concern, except that instead of paying dividends to the stockholders all net profits will be devoted to scientific research.

TORONTO STRUCTURAL STEEL CO.

ANOTHER vision of Sir Max Aitken, conceived during his trip through Canada, is about to assume definite proportions in the re-organization of the Toronto Structural Steel Co. The great difficulty experienced by builders in obtaining sufficiently large quantities of structural steel and the fact that the importation from the United States of this article is on the increase led him to believe that the development of the industry could be made very profitable, and so as a nucleus he and several other prominent financiers obtained an interest in the Toronto Structural Steel Company, and had the capital increased from $200,000 to $1,000,000, to be divided $500,000 in preferred and $500,000 in common stock. More than half of this has already been purchased by Sir Max Aitken's friends, and it is expected that the balance will also be disposed of privately, although a small public offering of the issue may be made at par. The stock will bear dividends of 7 per cent.

The present plant of the Toronto Structural Steel Co. is on Atlantic Ave., and has a capacity of 3,000 tons of structural steel a year. A new plant will be erected near Weston, with a capacity of 15,000 tons a year and provision for double this amount. Seventeen acres of land have been acquired. Among the directors of the company will be Messrs. Alex. Longwell, Geo. Gowanlock, F. P. Jones, of the Canada Cement Co., and R. M. White, of the Royal Securities Co.

C.N.R. SHOPS AT TORONTO.

IT is only a question of a few months now before work is started on the new Canadian Northern shops for the Toronto district. They will be located to the southeast of the new Canadian Northern Model City at Leaside. In all probability seven or eight hundred men will find work as soon as the shops are opened, and this number is likely to be doubled, if not tripled, as the business of the Ontario division of the line increases. Sir William Mackenzie recently stated that, although he could make no definite announcement as to the commencement of the work, it was quite probable that operations would begin ere the present year was out.

No freight cars will be built at the new shops, as the company finds it cheaper and better to purchase new cars from the car companies. Large repairing works, both for cars and locomotives, are, however, planned, and well-founded rumor has it that extensive locomotive-construction shops are on the tapis.

Provision for Employes.

Provision has been made for the housing of the workmen in the new Leaside townsite. Immediately adjacent to the shop site a number of streets have been laid out in smaller lots than is common in the townsite, while one is so divided as to be intended obviously for a business street to supply the needs of the C.N.R. employes.

The Canadian Northern is also contemplating the formation of a new station at the southeast of the new Leaside property, to provide easy access to North Toronto for the suburbanites. The precise location of this is still uncertain.

HIGH PRESSURE GAS FOR MANUFACTURING.

IN a paper on "High Pressure Gas for Manufacturing Purposes," Mr. A. W. Onslow states that experience has shown that, with gas at 50 cents per 1,000 cubic feet and coal at $4.90 a ton at the furnace, there is very little difference in the cost of the two methods of heating; the difference being in favor of gas, when used for practically all commercial purposes, provided the gas furnaces are designed with a view to the greatest economy. There are instances where gas is infinitely cheaper, cleaner and more suitable in every way. The exception is with large furnaces when immediate contact of flame with refractory material is difficult.

NOXIOUS GASES IN CUPOLA OPERATION.

FOUNDRIES are often heard to complain that men working near the cupola are troubled by escaping gases, especially if at work near the tap-hole or the charging platform. This is disagreeable as the men become sick and lose in efficiency.

Tap Hole Trouble.

The opinion has often been advanced that the escape of gas from the taphole and the charging platform is due to the same causes. This is not true, however, as is shown by the very fact that in some foundries only one of the two places mentioned gives trouble. It seems strange that complaints were much less frequent in former years with the old type of cupola, and that the more recent cupolas with forehearth give most cause for trouble. The reason for this may be, that the blast from the tuyeres enters through the coke charge, and reaches the forehearth. In passing over the coke, the blast absorbs a considerable quantity of bad combustion gases which mix in the forehearth and give off a very obnoxious odor. There is no natural outlet for this gas, it escapes through every crack and leaky opening in the forehearth lining, and more so, since the air in the forehearth is under pressure.

Each forehearth has, however, one or more peep-holes, and since these do not close airtight in the majority of cases, we have here the greatest and most dangerous escape for gases. Attempts have been made to remove these gases artificially, but without result. The Krigar furnace tries to remedy matters by connecting the peep-hole with the blowers direct and thus blow fresh air into the forehearth; but even this method is not satisfactory, and the best that can be done is to make the lining of the forehearth as airtight as possible.

Charging Platform Trouble.

The second source of trouble lies near the charging platform and is more serious, since the quantity of gases escaping is much greater. Here, also, the older cupolas without spark chambers, were strangely free of this nuisance; but the cupolas with spark chambers give much trouble. This does not mean, however, that the spark chamber is superfluous. On the contrary, it is an absolute necessity so as to eliminate the dangerous emission of sparks. It is also a fact that the proper arrangement of the spark chamber will little influence the emission of gases. The trouble was in most cases that the spark chamber was arranged directly above the floor of the charging platform, so that all iron and coke charges had to reach the cupola by way of it. Since the spark chamber is, however, the real collecting point for furnace gases, it was natural that the imprisoned waste gases sought their way out through the charge opening of the spark chamber and reached the charging platform direct, molesting the men there.

Within the past few years, foundries have built their spark chambers starting at a height of about 7 feet above the charging platform floor. The charges are, therefore, sent to the cupola without passing through the spark chamber. The escaping cupola gases, however, having a uniform rate of speed due to the diameter and construction of the furnace, go directly to the spark chamber, passing the charge opening without escaping to the platform. The cost of this type of spark chamber is of course somewhat greater than the first type, but the results, reckoned from the health and efficiency standpoint, more than pay for the higher cost.—Eisen Zeitung.

SOUTH AFRICAN STEEL WORKS.

AT Dunswart, East Rand South Africa there is already a small but well-equipped and busy iron and steel works, with a capacity of 20 tons of finished product per day. It turns out rounds, squares, flats and angles, as well as rails up to 20 lb. per yard weight, tube mill pegs—an article in considerable local demand—and also concrete reinforceing bars, using as raw material iron and steel "scrap." Up till lately "scrap" could be had for the carting away, as it was only so much lumber at the mines. The price at which the new South African Steel Corporation has purchased all the accumulations of the South African railway is $5.00 per ton delivered. At this price all the "scrap" of the railways has been secured for the next sixteen years.

LIFTING MAGNETS.

EXPERIMENTS recently made at the Zenith furnace in Minnesota have resulted in practically doubling the capacity of the lifting magnets employed for handling pig iron. Formerly this method of handling furnace pig iron was restricted to the quantity that could be lifted by the ordinary plan of picking up the iron from the ground or floor, and with the pigs lying flat, only a relatively small number would adhere to the magnet. In these experiments the pigs were stacked vertically by standing each erect on its end. This arrangement allows a greater number of pieces to make direct contact with the magnet pole-pieces, and the lifting capacity of the magnet is correspondingly increased. With a given magnet, which was able to pick up only 1,000 lbs. of pigs lying flat, it was found that when the pigs were stacked vertically on the floor the load was increased to 2,000 lbs. The increased lifting capacity was obtained with only a slight additional expenditure of labor on the stacking of the pigs.

COMMERCIAL TENDENCIES IN MALLEABLE CASTINGS PRACTICE.*

By Dr. Richard Moldenke,
Watchung, N.J.

AS is well known the production of malleable castings is carried out in America almost entirely with a view to obtaining the "black-heart" variety, while in Europe the white steely fracture is the rule. The latter material may be readily machined and finished with little loss of strength, but the "black-heart" suffers seriously if the skin of the casting is removed. The differences lie primarily in the heat treatment given the two varieties in the percentages of phosphorus and sulphur used, and finally in the service they are put to.

The Semi-Steel Feature.

The question of strength of malleable castings is not always a serious one, and often something just a little better than cast-iron is wanted. Malleable castings machine up easier than do those in steel. Again, where no labor is to be expended upon the malleable casting, as is practically always the case with the "black-heart" American variety, there is the somewhat natural tendency toward making the least weight do the work. and were this commercial consideration always accompanied with the proper understanding of the characteristics of the material

*Paper read at the 6th Congress of the International Association for Testing Materials, New York, August 1912.

involved, there would be no harm done; but where the consumer forces the manufacturer to take chances that his better judgment would not sanction, then it becomes a serious matter. In the first case, this continual demand for a better grade of material is a good thing for the development of an industry since stricter specifications are made and methods of production are improved; in short, a pound of iron is made to go further in the service of man than it could before.

On the other hand, the following may be said: That in the entire range of the casting industry there is a present tendency toward running up the more striking characteristics of a material to a point of excellence at the expense of others, none the less valuable. For instance, instead of making use of the ordinary malleable casting, as readily made from good irons under standard conditions, a grade of cast-iron made with the plentiful addition of steel to the mixture, and advertised as "semi-steel," is substituted on account of its lower cost. Again, instead of using the steel casting direct, where a high tensile strength is desired, a very-low-total-carbon malleable casting is made to do, because it is cheaper. The result of this shortsighted policy is the production of a series of supposedly high-grade materials which in reality are very unreliable. The principal sufferer is the consumer who does not make any specifications, but gets the bulk of the metal that has to be made to satisfy the one who does. The latter, who may need only a limited quantity, asks for the almost impossible, and the product is probably entirely unsuited for general work.

American Export Trade.

Attention is directed to the above tendency in America at this time, because the export of "black-heart" malleable castings is beginning to be a factor in international trade. With a present American production of some 800,000 tons of these castings, and a capacity of over a million tons annually, there is bound to be some investigation on the part of consumers in other countries relative to the merits of the material in question. This in turn compels the producers of those countries to take notice and will naturally affect their practice.

So that the matter may be better understood, a few necessary details of production are given:—In regular malleable melting practice, both in Europe and America, a limited amount of steel scrap is added to improve the material. This effects an initial reduction in the total carbon with a consequent increase in the tensile strength of the finished castings. With the very best of irons, short heats, first-class annealing conditions, and in fact the carrying out of the processes which are calculated to give the best results, it is not possible to get a very high tensile strength without sacrificing some of the shock-resisting properties for which the malleable casting is justly famous. Thus, the ordinary "black-heart" product as tested transversely by means of the 1 in. square test-bar placed on supports 12 ins. apart, should stand a load of 3,000 lbs., applied at the centre, and give a deflection of at least ½ in., and in exceptionally good material the deflection may run even beyond 2½ ins. The tensile strength of such test-bars will, however, not run much over 42,000 lbs. per sq. in. It is quite possible, by a heavy initial reduction in the total

DR. RICHARD MOLDENKE
Secretary, American Foundrymen's Association.

carbon through steel scrap additions, to obtain tensile strengths of above 58,000 lbs. per sq. in., and when extreme care has been exercised in the melting and annealing processes to keep oxidation of the metal down to a minimum, the deflection will still be good. The chances are, however, so very much against this, even in the highest type establishments, that whoever insists upon this high-grade material and bases the calculation of his structures, involving risk of life, thereon, makes a serious mistake. He had much better specify the steel casting in the first place.

As a mere item to show the delicacy of the manufacturing process, there may be mentioned the fact, well known to the producer but perhaps not at all to the consumer, that with composition and manufacturing processes identical up to this point, castings taken from saggers dumped on Monday morning— the one day when the annealing ovens are discharged cold—are much softer, bend and twist better, and are in every way more desirable as malleable castings, than those obtained the other days of the week. Yet the tensile strength of such castings is considerably below those dumped out hot.

Malleable Casting vs. Cast Steel.

The malleable casting differs from all others in that any attempt to correct the oxidation of the metal in a heat before pouring so increases the expense that it cannot compete with cast-steel. With the addition of much scrap steel to a charge, with the personal equation of the probable low type of melter, and with the probable variations in the annealing temperatures an attempt to work for very high tensile strengths is not followed by reliable results. The chance of oxidizing the iron in addition to the silicon and manganese is such that a more or less open crystalline structure results, with consequent penetration of further oxygen during the annealing process, weakening the casting. This may be readily seen from the effect of changing to coke irons from the charcoal varieties. Charcoal irons, with their high total carbon and comparative freedom from oxidation as blown in the furnace, when compared with the coke irons, gave the foundryman a chance to obtain good castings in spite of slight unavoidable variations in his practice. In American practice, at least, the change to coke irons has compelled the raising of the silicon specified in pig irons, in order to avoid this chance of initial oxidation as much as possible.

Until we have better melting methods (possibly when the electric furnace has been sufficiently developed along lines of economical production), and until we can obviate or cheaply correct any undue oxidation of the molten metal before it is cast, it would be wise to lay more particular stress upon the development of the malleable casting commercially along lines of greater softness rather than high strength. Where the latter is essential, the steel casting is certain to replace it sooner or later. On the other hand, with the specifications so shaped that the resilience of the material is made prominent for ultimate development, the excellencies of this peculiar product of the casting industry will be brought out and the material kept in its proper sphere of usefulness.

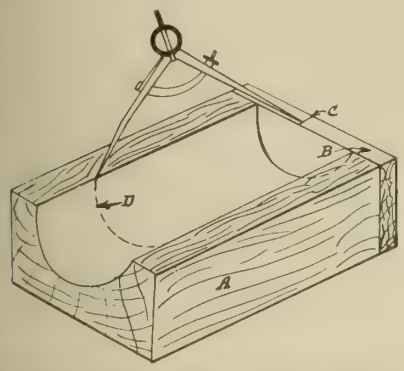
DRAWING CENTRE LINES ON CORE BOXES.

By H. J. B.

THE usual methods followed by patternmakers, when required to scribe a line across a half round core box, is to plane a piece of wood, square on one side and an edge, lay across the

joint of the box, and mark with a scriber laid against the block. This may be satisfactory if the box is shallow, but if it be of abnormal depth the chances are that it will lead to error. Others again, use a piece of flat steel or an old clock spring. This also varies, and if the box be of any size, it is impossible to draw a straight line by this means.

The following method is not only quicker but absolutely accurate and may be used in a number of ways both in core boxes and patterns:—If (A) be the core



DRAWING CENTRE LINES ON CORE BOXES

box, and (B) a block, or the end of the box, and (C) the centre line of the diameter, place one point of your dividers or trammells anywhere on the line (C) and with the other point scribe the centre line across the box. This gives an absolutely straight line around a core box, providing, of course, that the box is part of a true curve. The method may be used not only in semi-circles but in less or more than a half circle, by merely raising or lowering the point (C) to bring it in the centre of the circle. A second glance will show that the point (C) is the apex of a cone and the scribed line (D) the base, so that no other proof is needed to prove the accuracy of the means employed.

MOLDING A LARGE PIPE.

By Fides.

SOME time ago it fell to our lot to make a casting like that shown in Fig. 1. It was decided to sweep it.

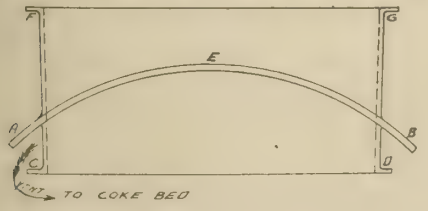


FIG. 1. MOLDING LARGE PIPE CASTING.

This would, of course, have been an easy task, but for the flange A.E.B. with its ever-changing angles. However, after talking the matter over with the draftsman and patternmaker, and on their suggestion, we made up our minds to form the flange A.E.B. with a sweep, because

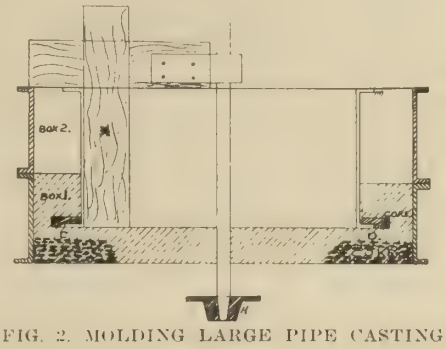

FIG. 2. MOLDING LARGE PIPE CASTING.

other methods thought of were too costly.

To begin with, the spindle seat A, Fig. 2, was bedded level in the floor, central to a box-part which previously had been placed in position. The spindle with its sweep attachment was inserted in spindle seat A, and a coke bed properly laid upon which sand was rammed to form the bottom of flange CD; the top of flange being formed by a core as shown in Fig. 2. After the flange cores were set to gauge, sand was rammed behind them to keep cores in place, then some waste was tucked in the flange cavity to keep the sand from being pressed in. Sand was next rammed up to top of flange A.E.B. and vents made down to

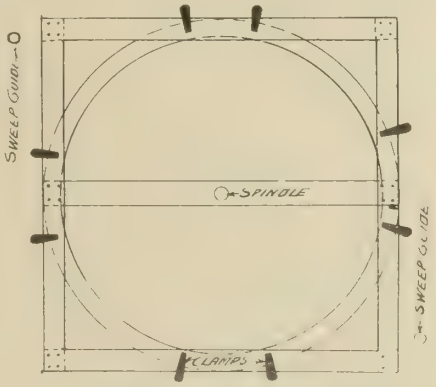

FIG. 3 — MOLDING LARGE PIPE CASTING

coke bed, Fig. 1. A box part, No. 2, which had been placed on box part, No. 1, when sweep was set for height, and afterwards removed, was now replaced. Sweep guide O, Fig. 2, was clamped to flange of box part No. 2, a hole in centre to let spindle through, guiding it to its proper place. Top of flange A.E.B., Fig. 3, was now swept with sweep board O.O. This had pieces 1 and 2 made so that they could be removed to let sweep travel further in box, Fig. 4.

Sweep guide O, sweep board OO, and box part No. 2 were removed and a parting made at A and B, Fig. 5. Our first idea was to cut the flange out at this stage, fill with dry sand, cover with paper, then ram to top of mould and clean out afterwards when finishing. We thought, however, we had better check it off to get a chance to finish it properly. Box part No. 2 was replaced again, and bars bolted to it to carry outside. Our standard round boxes are all drilled to space, so that bars can be bolted to them in case they are needed for any job. Box part No. 2 was again removed, clay washed, joint fixed, dusted with parting sand, box replaced and sand rammed in to top of casting F.G., Fig 5. The sweep was then replaced, and inside of pipe swept, after which the sweep was removed. The anchor plate to lift out inside core was now bedded level with bottom of flange C.D., Fig. 5.

The mould was covered with paper and core rammed up, venting being done and

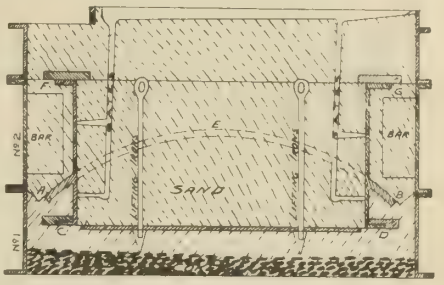

FIG. 5 —MOLDING LARGE PIPE CASTING

rods placed at intervals as the work proceeded. The casting being run from the centre, core gates and runners were placed in position as shown during the course of ramming up. The top of mould was now swept off and centre lifted out, finished, blacked, and put in stove to dry. Sweep X with thickness piece attached, was replaced and outside of mould swept to shape. Box part No. 2 was lifted off finished, blacked and laid aside. The flange A.E.B. was cut out with the trowel, having for guides two pieces of wood to gauge thickness and width of flange; one piece being made a little longer than the other. The waste was now taken out of bottom flange cavity, and the whole finished and blacked. Box part No. 2 was replaced, after which needed finishing touches were given.

A fire pot with coke fire was placed in centre of pipe and mould covered until dry. When mould was thoroughly dried, fire pot was taken out, ashes cleaned

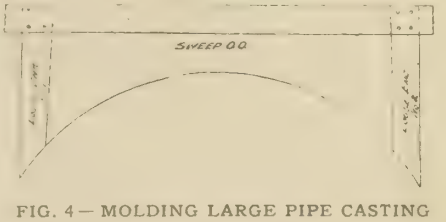

FIG. 4 — MOLDING LARGE PIPE CASTING

away, centre core replaced, top flange F.G. covered with cake cores, cope lifted on, rammed up, runner basin made, mould weighted and cast.

FIRST PRINCIPLES OF PATTERN-MAKING.*

By T. R. Schofield.

MY present paper is an attempt to outline briefly the fundamental principles on which the work of the patternmaker is based, as modified by the influence of modern engineering and foundry developments.

"That which goes, is right," is not the sentiment which has brought engineering to its present state of efficiency, and it is a sentiment of which the pattern-maker above all others needs to beware, if he thinks he has attained finality in his methods. His very existence, almost, is bound up inseparably with the continued progress ofengineering, and should finality be reached in mechanical engineering, the patternmaker, who is the first to benefit from new designs, would be the first to suffer from continuance on stereotyped designs.

The Patternmaker's Status.

When engineering made its first great advance, considerations of economy and expedition caused the pattern-maker to take his place as a specialist in this branch, in succession to the old-time millwright. Since then, progress has been very rapid, but still, generally speaking, the same motives which made him a specialist continue to be a controlling factor in deciding on the correct form which his work shall take. The wisdom of his decision is not in question in the case of simple elements, when the pattern is merely a facsimile of the requisite castings, though sometimes such patterns are rather more ornamental than useful, bearing evidence that time has been spent importing a fine finish, which time could have been devoted to gaining a more accurate conception of the purpose for which the pattern was made.

Pattern-Making Demands High Degree of Intelligence.

In castings of more complex form, however, the design usually admits of several methods of molding, and the advisability of the use or avoidance of cores and drawbacks has to be settled before the pattern is begun; then the decision arrived at assumes a considerable degree of importance to the foundry concerned. Errors of decision in these elemental matters frequently involve the foundry in expenditure of labor which might be avoided. It is of paramount importance, therefore, that the pattern-maker should possess a tolerably exact knowledge of foundry practice and foundry economy, in order that the patterns provided shall involve a minimum of labor to produce the molds and cores.

The first problem which the pattern-maker has to solve, then, is the finding of that particular way, of all the possible ways by which a casting can be made, which shall fulfill the requirements of the foundry to the best advantage. In time past, when patterns were laboriously hand-made and the conveniences now common in up-to-date pattern-shops for rapid production were almost unknown, many ingenious methods were evolved, enabling castings to be obtained from a somewhat meagre pattern preparation. Such castings were not always as true as might be; some of the niceties of design had to be sacrificed, and allowance for machining had to be somewhat generous, to cover inaccuracies. Still, such methods and such castings suited the needs of the time. Contingencies still occur when these makeshift methods are justifiable, as, for instance, the familiar "1 off" job in some of its forms, and the bona fide breakdown. Knowledge of these "cheap" methods form no small part of the pattern-maker's stock-in-trade, but they have tended to become stereotyped into standard methods.

If it is granted that real patterns are essential to bring us nearer the ideal of foundry efficiency, in conjunction with the enormously increased facility with which a pattern can now be made for a correspondingly reduced cost, it is evident there is not now the same justification for adoption of makeshift methods as formerly, and that continued persistence in such methods constitute a serious bar to legitimate foundry progress.

Everyday Problems.

With these few remarks by way of introduction, I propose now to present the case for a more rational handling of the everyday problems of mutual concern to pattern-maker and molder.

The past ten years have witnessed intensified concentration on the part of engineers, in those spheres which are peculiarly theirs, viz., the efficient utilization of natural scources of power, and the acceleration of production. Among prime movers we now have, for very high powers, the steam turbine and internal combustion engines for both gas, oil and spirit, placed upon a commercial basis. Increased efficiency, higher speeds of rotation, and higher range of temperatures, also the cutting down to a minimum of clearance spaces, have resulted in increased complexity in the castings forming the principal elements of these engines, and have brought into prominence the need for greater precision and uniformity in such castings than has ever obtained hitherto. Leaky joints and much expensive machining and fitting are obviated by combining in a single casting, whenever possible, elements which have hitherto been made separately. These combinations are characteristic of the time, and involve both the foundryman and pattern-maker in greater responsibility for their satisfactory production.

In the sphere of rapid production, the scientific study of the principles underlying the best use of metal-cutting tools, and the introduction in recent years of high-speed steel, have completely revolutionized the design of machine tools. All-gear drivers, quick-change gear boxes and other time-saving, production-increasing features incorporated in their design, have transformed the simplest of them into more powerful, more productive, more nearly automatic machines. Standardized methods of handling castings in quantities for machining, to reduce costs, with the need for interchangeability, have resulted in the application of jigs for all possible purposes, and only serve to emphasize the need which exists for the highest degree of precision in the castings supplied.

(To be continued.)

*From a paper presented at the recent annual convention of the British Foundrymen's Association.

RADIAL BUFFER.

AN American firm has recently placed on the market a radial buffer, which consists of two castings, one bolted to the engine and the other to the tender; also two other castings and a wedge. Wear in the draw-bar pin holes or pins is taken up by adjusting the wedge in or out, and the draw-bar may be easily uncoupled by withdrawing the wedge. The faces of the two buffing blocks are radial with the centre of the pin holes in the draw-bar, and the floating block between them permits the engine and tender to take any position without changing the distance between the centres of the pins. There is no strain on the draw-bar and pins except when the engine is pulling.

Buffers of this type which have been in service for a considerable time indicate that there is very little wear of the castings, draw-bar pins, and pin-holes. The design is such that there is no necessity for the slack to exceed 1-16 in., thus improving the riding of the locomotive and eliminating the jerking action when drifting at high speed.

It is just as well not to despise the outsider; he often has the best view.

The John Inglis Co., Strachan Avenue, Toronto, have acquired a large section of the prison property, immediately adjoining their present plant, and will erect and equip thereon, one of the largest boiler factories on the American continent.

OIL FUEL ON THE MEXICAN RAILWAY.

THE whole of the Mexican railway locomotives have now been fitted with oil burners, and such difficulties as arose with regard to the drivers and firemen have been completely got over. It appears that when oil was first introduced, every possible difficulty was put in the way by the English and Scotch drivers, most of whom resented the change, and in some cases refused to work the engines with oil. As regards the Mexican drivers there was less trouble. They were shown how the oil fuel should be applied, and how to work the engine under the new conditions, and to the best of their ability followed the instructions without cavil. Subsequently a curious position was developed. There was a difficulty in the oil supply, and many of the engines had to be reconverted and again fired with coal. The Scotsmen in particular, who had been most conspicuous in their obstinate resistance to the use of oil, made louder lamentations over the resumption of coal than any other section of drivers. However, all that is now done with, and the new system works exceedingly well in every respect, and is regarded by the whole staff as an immense improvement on the coal burning method.

With regard to the economies effected by this change of fuel, it may be said that the management do not by any means regard the existing arangements as the end of the advantages to be derived. Further developments in the way of organization are under discussion, and further substantial reductions in the cost of haulage are hoped for in the future.

OIL FUEL FOR INDUSTRIAL PURPOSES.

THE progress made on the sea by oil has been so rapid that, except for railways, its uses on land seem to have been almost forgotten or overlooked. Of course it has been recognized that in oil centres such as California, it is used in factories to the exclusion of coal, and also in Russia to some extent, although to what extent, the public has no idea, and contents itself with repeating that "the old ways will suit us for years to come. It was a remark made by a late chairman of the London General Omnibus Co. in regard to the use of horses when the Vanguard buses first came on the street, six years ago, but all the horses have gone now, and the prophecy has been falsified.

The Future Outlook.

All the same, people go on saying coal will be our mainstay for a long while yet, for how can oil which is not at our doors compete with coal which is? Well, it can and it begins to do so. The chief hindrance is that oil in this country for the moment is in the hands of two or three big concerns, who charge whatever prices they like, and are able to do so, owing to the fact that there are not ships enough to bring competiting cargoes. Time—and not a long time even; will alter all that, and what then? As soon as this happens there will be a great increase in the consumption of residual oil for manufacturing purposes.

Mark what has taken place. At the beginning of the 19th century, when all Europe was at last reduced to peace, we through the proximity of our natural resources and fruitfulness in invention captured the first place in the trade of the world, and have held it for nearly a century. The comfort of a fat living checked the inventive faculty, and other nations took pride of place as inventors, being forced by pressure of events to find labor saving appliances, the need of which we did not feel. As they progress commercially, we in turn feel their pressure and the faculty begins to return.

Necessity, that fecund mother, is called upon to bear children, and again responds to the call. Thus in the heart of our coal and iron district is born an oil furnace, bringing into use the burner of old Bunsen, which produces an intensity of heat by a simplicity of method, with an economy of cost, which bids fair to revolutionze many industries. Already, certain manufacturers find that by means of it, they can do the work of thirty men with the aid of one, and already the glass bottle trade by its use begins to return to the country.

Oil Fuel in General Use.

Already the biscuit princes of the country are installing it in their factories, and a long list of applicants await the delivery of their orders. It is used by steel makers, tube drawers, glass makers, and for china burning, roasting of ores, calcining lime, manufacture of cements, melting, armor plate making, etc., etc. The invention is the work of two men whose labors would read like those of Palissy—a real Samuel Smiles , self-help tale, whose only barrier to advance is want of sufficient capital to finance their orders, and the difficulty of obtaining enough oil at present to supply their customers.

The system is not alone in the world —other countries have been before us and if it were, it would soon have rivals, but what interests us is, that it seems to make a long step in the advance of oil as a fuel on land, and, further, that it must have the effect of distributing industries more widely over the country. No longer must it be necessary for the steelmaker to live in a grimy city, where the foulness of smoke pollutes the freshness of the air, and the sordidness of surroundings debases the moral character. The cleanness of Pittsburg will be the lot of other centres, and haply the Smoke Abatement Society find less opportunity for its labors.

A long way off, all this, but big oaks from little acorns grow, and those who have the keenness of vision to see into the future—the Cowdrays and Furnesses —are already girding up their loins to get a share of the spoils, building argosies to carry oil to these shores.—The foregoing is from the H. S. Stoneham, London, Weekly Statement.

A FEW NOTES ON GRINDING.

By Cosmopolite.

THE following remarks are prompted by a conversation held with a grinding machine operator during a visit paid by the writer to a large firm of textile machinery manufacturers. This man was running two machines engaged on work of a simple character, but necessitating close adherence to size. Both machines were running with the maximum table travel obtainable. One machine (American) was fitted with a wheel 2 in. wide, the other (British) with a wheel 3 in. wide, the travel per revolution being in each case very nearly the wheel width. The comparative output of the two machines varied approximately as the wheel width. Judging by the way the wider wheel was taking its cut, it seemed possible that a still wider wheel could have been used, if the table travel could have been increased in velocity to harmonize with it, with a corresponding increase in output.

Speeding-Up Feature.

Now, this is the point on which the writer wishes to insist. Speeding up is the cry of the day. To some extent this has been met in most tools of modern design, and the machines are now probably more than equal to the demands of the now superior cutting tools. In the grinding machine, however, on certain classes of work, although no doubt makers have believed themselves, equally with ordinary machine tool makers, ahead of the tools (in this case grinding wheels) obtainable, they are still behind. What is the reason for this?

The output of the grinding machine depends almost wholly upon the speed of table travel. If this is but 6 ft. per minute, neither wheel speed, work speed, nor width of wheel can be modified to increase the output.

What are the difficulties in the way of using a faster table travel? From a somewhat careful examination of vari-

ous grinding machines we would assert that beyond doubt the difficulties are wholly constructional. With existing reversing mechanisms for the table travel, the shock is so severe as to occasion the periodic breakdown of the clutches. Surely some form of shock absorber is possible of incorporation. The British machine examined had a friction slipping device which partially overcame the trouble; but even in the event of this difficulty being overcome, it might be argued that still another source of trouble would be the extra weight of the wider wheel needed to cope with a faster table travel.

In reply to this, the writer would say that if the parts carrying the wheel were enlarged to the size they are on a larger machine, and other parts of the machine strengthened to correspond, this difficulty would be met. There is, of course, always the factor of the balance of the wheel to take into account, but this would be met exactly as it is on larger machines. In fact, on all machines, no matter the size, it is advisable to true up the wheel when it is running at the speed at which it is to run when at work.

It is, of course, advisable to roughly true the wheel at a lower speed than the working speed, for the sake of the life of the diamond. The reason for truing up at running speed is as follows. No wheel can be guaranteed to be thoroughly homogeneous in structure. Hence, if turned true for one speed, an increase in speed may destroy the running balance again. For this reason, in dealing with work having more than one diameter, it is better to avoid changing speed for the different steps, although by doing so, frequently a more efficient cut is attainable.

Table Travel and Wheel Width.

Again, it may be argued that an increase in table travel and wheel width will result in a greater tendency to spring the work; but the steadies will take care of this. In modern grinding practice, it is becoming more and more a golden rule: "Get as many steadies on as the work will permit."

Let us, however, take the case to its extreme. Imagine a wheel as wide on face as the length of the work, and let this wheel be trued up so that it would produce work true and parallel by the cross feed only. The amount of metal being removed per unit of length is remarkably small; the depth of the cut being probably but one or two thousandths, under normal grinding conditioss. Is it likely that the spring of the work or machine would be inordinate? At the wheel the pressure is exceedingly small on account of the cut being shared amongst so many cutting edges. Imagine the number of cutting edges passing the work in, say, a minute. The pressure on the work cannot be any greater than that on the wheel, any more that the pressure on the teeth of two intermeshing gears can be different. No, it is not pressure, but vibration that counts, and absorption of vibration can be secured by attention to the arrangement of the steadies, and mass in both these and the machine parts.

Pressure Feature.

At any moment the number of cutting edges passing or in contact with the work at a given instant, determines the total pressure on the wheel. This pressure varies directly as the width of the wheel and can be resisted by increases in the strength of parts. As regards the work, the pressure per unit of length is a constant, capable of being dealt with by arrangement of steadies. In any case the steadies are necessary as absorbers of vibration, as has been already pointed out. With a given wheel speed the width of the wheel has no influence whatever on the pressure per unit of work length, as the number of cutting edges in contact per unit is invariable, Thus, the wheel width and table travel may be anything that the detail construction of the machine will permit.

Conclusions.

To sum up:—Although the advance in the art of grinding has been exceedingly great, there is no reason to suppose that finality has been reached. Is many cases the lathe has received a powerful competitor, even as a roughing-out machine, in the grinding machine. With greater attention to points, such as those cited, who can say that the lathe will not for many purposes be entirely ousted? The writer has endeavored to show where the weakness lies, and that it does not, as many opine, lie in inherent incapabilities of wheel or work. Perhaps grinding machine manufacturers will take these few hints to heart and eventually produce a machine capable of filling a still more important position than it now holds in the scheme of intense production of the present day.—Page's Weekly.

—⚙—

Insufficient Illumination.—It is estimated that 25 per cent. of industrial accidents are due to insufficient illumination. This is particularly true where workmen pass from daylight to places lighted artificially. The artificial light may be sufficient for those accustomed to it, but the eye does not respond immediately to the change in light when passing from a very bright illumination to a place lighted at low intensity. It is therefore, important that lamps be placed along walkways and thoroughfares rather than distributed uniformly over the whole floor.

Trade Gossip

Mr. E. G. Buckwell, secretary and manager of sales for the Cleveland Twist Drill Co., sailed on the Carmania on October 5 for a business trip abroad of two months' duration.

The Smart-Turner Machine Co., Ltd., Hamilton, Ont., have recently secured the following orders:—Mr. E. D. Smith, Winona, duplex pump; Prince Arthur Hotel, automatic feed pump; Mr. S. I. Strong, Napanee, Ont., rotary pump; Great Lakes Dredging Co., duplex pump; J. P. Mullarky, Sydenham, Ont., duplex pump; New Brunswick Pulp & Paper Co., Millerton, N.B., duplex pump; Deloro Mining & Reduction Co., Deloro, Ont., centrifugal pump; Mr. James Stark, Paisley, Ont., centrifugal pump.

The Hill-Leonard Engineering & Construction Co., Toronto, Ont., will handle general construction work through that province, especially railway supplies. Its equipment consists of the type of machinery necessary to this line of work and the company will be in the market from time to time for additional supplies, including dump cars, small locomotives, shovels, drills and small tools, such as scrapers, etc.

Messrs. Herbert Morris Ltd., a Canadian company recently incorporated, have established headquarters in Toronto, at 79 Peter Street. They will represent, in Canada, the well known English house, Herbert Morris & Bastert, Ltd., Empress Works, Loughborough, makers of Lifting and Shifting Machinery. Agencies will be maintained in Montreal, Winnipeg and Vancouver and a stock of Chain Blocks and Hand Cranes will be carried at these places and in Toronto. A stock of heavier lifting machinery, overhead travelling and swing cranes, etc., is carried at the works, and quick delivery will be made on Canadian orders. Malcolm R. Meldrum M.E. is general manager of the new company.

The Canadian-Cleveland Drill Co., Ltd., Toronto, who handle for all of Canada the air tools manufactured by the Cleveland Pneumatic Tool Co., of Cleveland, Ohio, have moved from their old quarters, 24 Adelaide Street West, to 80 Duchess Street. They have added greatly to the supply of tools and repair parts carried in stock and have also installed an 8 x 8 air compressor, electrically driven, for demonstrating tools to visitors and also for use in their repair shop. This move on the part of the Canadian-Cleveland Drill Co. puts them in a position to have a large stock of tools on hand for delivery at all times, also repair parts, and in the event of repairs being required to their tools, these also can be attended to immediately at the shop in Toronto.

COR. STRACHAN and WELLINGTON AVENUES.
TORONTO, Sept. 27, 1902.

The General Fire Equipment Co.,

City.

Dear Sirs,—

FROM
JOHN B. SMITH & SONS
MANUFACTURERS OF
LUMBER, LATH, SHINGLES, DOORS, SASH, BLINDS, PACKING CASES, ETC.

We have had an experience with a fire a few nights ago which we think you should know about. In one of our lumber dry-kilns we had an iron shaft which was used to convey power into a machine shop beyond the dry-kiln. A coupling on the shaft became detached and the friction caused the iron to become red hot and set fire to the premises. This shaft is situated in the pit where our hot air pipes are, and although our large fan was blowing the hot air and the flames right into our kiln-dried lumber, your sprinkler heads opened and put out the fire completely. When the firemen arrived, the fire was completely extinguished. We think this speaks volumes for your sprinkler system and we hope that you may be able to let other manufacturing firms know about them and particularly about this fire.

Yours truly,
John B. Smith & Sons

"When the Firemen Arrived the Fire Was Out!"

This letter was received just ten years before this advertisement was written. The system of fire protection that saved the situation so promptly then is just as efficient to-day. It stands on guard here and in many another plant, ready to drown the stealthiest of fires.

Your plant—your machinery—your peace of mind should be protected by the same absolutely certain system—

Manufacturers' Automatic Sprinklers

Send for estimate on equipping your plant.

The General Fire Equipment Co., Ltd., 72 Queen Street East, Toronto

STEEL CASTINGS

Acid Open Hearth Steel for Locomotive and Machinery Castings.

Stock Process Steel for Automobile and Light Castings of all descriptions.

Our plant will be in operation early in October.
(Annual Capacity, 12,000 tons.)

Let us figure on your requirements.

The Dominion Steel Castings Company, Limited
HAMILTON, ONTARIO

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

FOUNDRY AND MACHINE SHOP.

New Westminster, B.C.—An agreement has been made between the city and the Heaps Engineering Company, whereby said company agrees to erect a machine shop and to employ not less than 100 men. The city's obligation is to go before the ratepayers soon for ratification.

Walkerton, Ont.—The Dominion Stamping Co, Ltd., has erected a large foundry in this city and is installing machinery of the most improved type. The paid-up capital of the company is placed at $250,000. Within 30 days it expects to have in operation one of the largest plants of its kind in the Dominion.

Portage la Prairie, Man.—One of the two important industries about to be established here is the Western Radiator Company. The promotors of the aforesaid company are well-known Winnipeg men. As yet, particulars are not made public

Regina, Sask.—The Kissel Motor Car Company, of Hartford, Wis., is about to locate here and in fact it is proposed to make this city its headquarters. The trucks made will be of the 1,500 pound type and of various powers; 30, 50 and 60 h.p.

Butte, B.C.—According to a report made by Patrick Clark, the Spokane mining capitalist, this is to be made the site for a plant which will be installed for the treating of copper ores.

Irondale, B.C.—Work will soon be commenced in the steel foundry of the Western Steel Corporation. Mr. Moore, the president, assures the people here that the plant is about ready and that men would be employed at once

Pembroke, Ont. — The Canadian Northern Railway, having received the assurance of a bonus of $25,000, exemption from taxation, and free water, has agreed to make this a divisional point at which machine shops will be erected.

Moose Jaw, Sask.—The Traction Plow Company proposes to erect a foundry for the manufacture of plows under certain conditions: An agreement has been made between the said company and the city whereby the city will sell, for the sum of $20,000, lots 1 to 20, block 28, for site for aforesaid foundry, or plant, and in return for same, the company agrees to invest between $150,000 and $200,000 in said industry and to employ at least 35 hands.

Galt, Ont.—The Hare Engineering Company will shortly commence operations here in the establishment of a plant to cost at least $100,000. The company has $400,000 subscribed capital, and among the shareholders are W D. Sheldon, J. Fergus MacGregor and Allen Hills, all local men.

Prince Albert, B.C.—Among the four industries that are to be established and which are seeking bonuses, is a foundry which will have a capacity of 14 tons per day.

Yarmouth, N.S.—The worst fire that Yarmouth has had for some time took place recently, when Sanders' Machine shop on Water St. was almost destroyed. The fire was first discovered in the attic. The attic room was full of patterns made principally of pine and very dry. The building, owned by Edward Allen, was badly damaged and there was no insurance. Mr Sanders had $2,500 insurance in F. K. Spinney's agency on the stock and the machinery, but this will not compensate for the loss of valuable patterns of many years' accumulation.

MUNICIPAL.

Tilbury, Ont.—The by-law to grant a loan of $5,000 to assist the Imperial Rubber Company in the establishing of a factory, received the endorsement of the ratepayers

Wilkie, Sask.—The following by-laws were recently passed:—to raise $28,000 for waterworks system; $2,250 for extension of electric lighting system; $2,250 re fire protection; and $8,000 for skating rink.

Kerrobert, Sask.—The burgesses have passed a by-law to raise $82,000 to cover cost of the installation of a waterworks system.

Kindersley, Sask.—The burgesses recently endorsed the two by-laws which provided for the raising of $1,000 and $3,000 for hospital and town hall respectively.

Nelson, B.C.—The qualified voters defeated the by-law to raise $75,000 for the acquiring of the Nelson Coke and Gas Company.

Port Colborne, Ont.—The council recently met and authorized the Reeve to issue debentures to the amount of $20,000 for the extension of the waterworks.

Raymore, Sask.—A by-law was recently carried whereby $5,500 will be raised by debentures to build a town hall.

Oshawa, Ont.—The by-law to raise $32,000 for the erection of a new public school on King Street was passed by the council at a recent meeting

Kindersley, Sask.—The ratepayers endorsed the by-law to raise $90,000 for waterworks and an electric light system.

Port Colborne, Ont.—The town council has passed a by-law providing for the issue of debentures to the extent of $20,000 for extensions and improvement of waterworks.

Macleod, Alta.—The following by-laws received the assent of the ratepayers:—to raise $50,000 for a new filtration plant, $50,000 for a sewerage disposal plant; and to raise $36,000 for a new trunk sewer.

Aurora, Ont.—The ratepayers voted in favor of the by-law to raise $15,000 as a loan to the Collie-Cockerill Company, manufacturers of office furniture.

Niagara Falls, Ont.—The waterworks pumping by-law calling for the raising of $7,000 was recently endorsed by the ratepayers.

Port Alberni, B.C.—The by-law to raise $100,000 for a civic waterworks system received the endorsement of the burgesses recently.

Duncan, B.C.—The ratepayers recently carried the following money by-laws:—to raise $25,000 for cost of waterworks system; $15,000 for a new school; and to raise $65,000 for electric light and power purposes.

Macleod, Alta.—The following by-laws have been passed by the ratepayers:—to provide for the raising of $81,000 re fitration plant; $50,000 sewerage; and $36,000 for sewerage extensions.

Tofield, Alta.—The following by-laws were recently endorsed by the ratepayers:—to raise $25,000 for waterworks; $43,000 distribution of gas; $4,200 for hospital; and to raise $1,000 for drainage.

North Vancouver, B. C.—A by-law to raise $50,000 to purchase additional shares in the Burrard Inlet Tunnel and Bridge Company will shortly be placed before the ratepayers

Kingsville, N.S.—The ratepayers will have the opportunity to sanction the raising of $10,000 to meet the present indebtedness of the corporation some time in the near future.

Sarnia, Ont.—The Town Council has decided to submit a by-law to authorize the raising of a new intake at Point Edward.

ELECTRICAL.

Lethbridge, Alta.—The first street cars to be put into operation by the municipality were started a short time ago when free rides were given to the citizens. The electric line is 10.5 miles in length.

Saskatoon, Sask.—The Automatic Electric company of Chicago has signed a contract with the provincial government of Saskatchewan for the installation of a new automatic telephone plant in Regina. The government was largely influenced by the successful operation of a similar plant in Saskatoon, installed by the company. The present capacity of the Saskatoon plant is 2,000

Cobalt, Ont.—The British Canadian Power Co. has been absorbed by the Northern Ontario Light and Power Co. The former concern operated soley in Cobalt, generating electric power at the Matabitchouan, and using part of it at their station on the Cobalt Lake for compressed air purposes at mines. They also supplied electric power. The present amalgamation marks the close of a long series of amalgamations, whereby the present situation in the north is being considerably improved. The Northern Ontario Light and Power Co now supplies power all over the north, having franchises in Sturgeon Falls, Cobalt, Haileybury, New Liskeard, Porcupine and Cochrane.

Willow City, B.C.—Telephone lines have just been completed into the town, and the Grand Trunk Pacific right of way camps are located at the mouth of the Willow river. It is the terminus of a spur of the Pacific and Hudson Bay railway from their main line through the Salmon River country to connect with the Grand Trunk Pacific. There are several other lines projected to reach the city. The townsite is being placed on sale by the Pacific Bond and Land Corporation, of Vancouver

Winnipeg, Man.—The Winnipeg Electric Street Railway has concluded negotiations for the purchase of its right-of-way as far as Stony Mountain. The grade is to be completed by the winter season.

Kamloops, B.C.—The burgesses recently endorsed the following by-laws:—To raise $250,000 for Hydro Electric purposes; and to raise $65,000 for electric light distribution. This means bringing unlimited power from Barrier River, and a basis for inducement to industries here

Caledonia, Ont.—Early in October it is expected that the town will be in readiness for the turning on of Hydro-Electric power. The town will then be lighted from the Grand Trunk Railway station to the river by the system.

Thornbury, Ont.—The by-law recently submitted to the ratepayers, providing for the raising of money for electric power, was carried by the ratepayers.

Humboldt, Sask.—The burgesses carried the by-law calling for the raising of $30,000 for electric light service

GENERAL MANUFACTURING.

Stratford, Ont.—It is reported that the McLeod Milling Co. will increase their stock to $200,000, and make extensive enlargements to the plant. This will make the mill one of the largest in this part of the country.

Oshawa, Ont.—The McLaughlin Carriage Co of Oshawa, have taken out a permit to build an addition to their factory, two storeys high, 250 ft. by 60 ft. Their present manufacturing facilities are inadequate to meet the increasing demand for McLaughlin motors. This large addition to an already enormous factory is an excellent indication of the prosperity of McLaughlin products.

Ideas at Two Cents Each

¶ An idea that's worth anything at all to a Mechanical man is worth more than two cents.

¶ It might be worth hundreds of dollars.

¶ Every issue of "CANADIAN MACHINERY" is full of practical, helpful ideas. You ought to be able to sift out four each month that would prove of some use to you. Put a value of two cents on each and your subscription has been paid.

¶ You cannot afford to miss even one issue—you might miss the idea that would be worth hundreds of dollars.

¶ The date on the label of your "CANADIAN MACHINERY" wrapper shows when your subscription expires. One dollar will renew it for a year.

Don't put off Renewing—Do it to-day

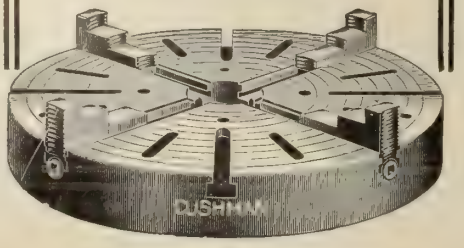
The Cushman Chuck Co.

Hartford, Conn., U.S.A.

Established 1862



Wainwright, Alta.—Wainwright's new flour mill, which is being erected by C E. Bird & Co., is expected to be ready for operation in ample time for the needs of the district, following threshing.

Owen Sound, Ont.—Contractor W. J. Campbell, Owen Sound, has received the contract for building the factory of the Superior Match Company Mr. James C. Grier has the subcontract for the foundation and the brick work which has already been begun. The whole project will be rushed ahead so that manufacturing may be begun during the month of November. The factory buildings will be of brick and steel throughout, the roof to be carried on sixty foot steel trusses, with no intermediate supports. The main building will be one hundred and eighty feet in length. While match factories are usually clean and well ventilated, it is planned to have the Superior factory unusually well equipped with sanitary appliances and fittings designed to assure the health and comfort of the employees. Rest and lunch rooms will be provided for the men and girls, separately Several directors of the match company were in Owen Sound recently, inspecting the building site and arranging details with General Manager McArthur. Mr. Gerard Muntz, of Toronto, president of the Share and Debenture Company, which has underwritten the match company stock states that no expense will be spared in making this the finest match factory on the American continent.

Canora, Sask.—A company, known as the Canadian-American Egg Company, Ltd., have secured the sole rights to operate the secret process for preserving eggs in Canada and they will proceed at once to the erection of a factory of large dimensions. It will be 100 by 125 feet, two storeys high, and will contain all the latest machinery

Elmira, Ont.—Fire recently destroyed the flour mill owned by Mr. G. Ratz. The mill which was built in 1866 has been operated by the one family since that date. The power house was saved and therefore the electric lighting plant. The loss will be about $12,000 with $7,000 insurance carried

Sarnia, Ont.—The Anker-Holth Manufacturing Company have decided to erect a branch factory here for the manufacture of cream separators, and other mechanical appliances. The company is well known in Chicago and its location here means an asset to the town.

Parry Sound, Ont.—The large veneer factory, mills, drying kiln and drying sheds of the Niagara Veneer and Basket Company was recently destroyed by fire. The loss is estimated at $100,000 with insurance to the extent of $25,000. The fire occurred whilst the men were at dinner, thus the flames had made considerable headway before being noticed

Montreal, Que.—Robert H. Reid, Vice-President of the Labrador Pulp and Paper Company has announced the increase in the capitalization of the company from $3,000,000 to $15,000,000. This large increase in capital will be responded to by extension of operations by the building of two large mills one at Hamilton Inlet and the other at Sandwich Bay.

PLANING AND SAW MILLS.

Moose Jaw, Sask.—The Rogers Lumber Yards Company of this place with a capitallization of $2,000,000, has been chartered to carry on a general lumbering business throughout the Dominion The directors are: Authur George, John Rogers, Peter Harvey, Alfred W. Jones, and Johnson Siehall, of Moose Jaw.

New Westminster, B.C.—A new industry has just been inaugurated by the Powell River Pulp and Lumber Company near here. The company, during the present season, has stripped its hemlock logs of their bark for use in tanneries or else for tannery extract.

Vancouver, B C.—Fire recently destroyed the frame, sash and door factory of Hatch Brothers at Cedar St. The total loss of the fire is estimated at $45,000, which is practically all covered by insurance. The cause of the fire is unknown.

Sudbury, Ont.—A deal has just been culminated within the past week whereby thirty acres of land on the lake shore, just outside the town limits of Haileybury, has been sold to the Lake Expanse Lumber Company, which will erect one of the largest saw mills in the north country. The property embodies part of the C. C Farr property and borders on the lake shore at Moore's cove. The new company is composed of Ottawa, Renfrew and Haileybury residents, prominent among whom are Councillor O. M. Hennessey and H. S. Hennessey of Haileybury The new company has purchased a timber limit of about 100 square miles in the Province of Quebec. From which it will take the lumber to Lake Temiskaming and then float it over to the new plant which will be erected next spring.

Leamington, Ont.—The sash and door plant of the Ludlam-Ainslie Lumber Company here

was recently destroyed by fire which is said to have started in the boiler room. The plant has been taxed to its capacity this season and its loss will be felt by the builders as well as men employed there.

Yorkton, Sask.—Plans are being prepared for the erection of a modern sash and door factory and planing mill by the promotors, the Messrs Logan and Black. The building will be equipped with the best and most up-to-date machinery and promises to fill a much felt need in the vicinity.

Runnymede, Ont.—James Staple's planing mill here was recently gutted by fire. The loss is $2,000, with $700 insurance. The origin of the blaze is under investigation.

Uxbridge, Ont. — Robert Reynolds, who recently purchased the Harman foundry, is excavating for a new planing factory on the north side of the foundry. The old shop just to the north of the main building has been removed and the new one will stand in its stead. It will be 40x60 feet, cement foundation and floor, one storey, and is to be equipped with modern machinery.

Toronto, Ont.—Defective fire alarms resulted in the large woodworking factory on Vanauley Street being completely destroyed. The fire which did damage to the extent of $10,000 started in the show case factory of H L. Woods.

BUILDING NOTES.

Toronto, Ont.—Work on the new million dollar technical school is to be begun this fall. Principal McKay had a huge roll of plans of the school to use in explaining certain projected changes, but the industrial advising committee failed to have a quorum A letter has been received from the architects Ross and McFarlane, Toronto, in which they say: "We are now preparing working drawings and specifications as to alternative plans for brick and stone for the exterior. We expect to have everything ready to begin work before the close of the year.

Duck Lake, Sask.—Duck Lake's new $7,000 town hall has been started. The building will be 30x70 ft., two storeys high with a basement and will be heated by a furnace. The building is to be brick veneer but owing to the lateness of the season the brick work will probably not be done until next spring. The rest of the work will be done this fall and it is expected that the building will be ready for occupying in two months. The construction will be done under the supervision of the Council by day labor Mayor Fawcett will supervise the cement and carpenter work. Councillor R. T. Shepherd is chairman of the hall committee. The site of the hall is on the corner of Victoria and Second Avenue.

Toronto, Ont.—The owners of the Queen's Hotel are considering the erection of an addition to their hostelry, that will involve an expenditure of $200,000, according to Mr Henry Winnett, one of the proprietors. The addition will be erected to the east of the present building. The ground is at present used as a garden for the guests and has a frontage of 100 feet. Plans for the proposed structure call for 75 rooms and baths, and in the interior the corridors will be continued throughout the entire building, all the rooms and furnishings being similar to those now installed in the hotel. The exterior will also be of the same design, and will, when finished, present an unbroken surface on Front street.

Saskatoon, Sask.—The Saskatoon Sanitary Laundry Co., Ltd., has been taken over by the Co-operative Laundry Co., Ltd. A new $100,000 plant is to be erected, and every device known to the modern laundry installed. It is stated that the new plant will be the most modern in Canada, and, as the men at the head of the affair come from the States, there will also be devices used which so far have never been tried out on this side of the line. In addition to the premises of the present laundry, which are located on Avenue C, between 22nd and 23rd streets, the new company has purchased 50 feet adjoining Avenue C, on which property it will erect the new laundry, utilizing the present building for dry cleaning and shoe repairing work, which will be an important department in the new business.

Vancouver, B.C.—The C. P. R. will begin construction in the near future, of a two-storey, brick and concrete building at the False Creek end of Drake street. The structure will cost in the neighborhood of $75,000 and will be used as the storehouse for the dining car department. It will be fifty feet wide and two hundred feet long and so divided that there will be ample storage room for the various supplies which are necessary for stocking up the dining cars.

Fort William, Ont.—It has been made public that the contract for the erection of the buildings for the National Tube company's plant in this city has been promised to M. H Braden, a local contractor. The plans and

INCREASING RAILWAY RETURNS.

CURRENT reports of the revival of railway traffic are verified by the official returns for the month of July compiled by the Bureau of Railway Economics from reports to the Interstate Commerce Commission covering over 220,000 miles; about 90 per cent of the steam railway mileage of the country.

The increases in net revenue were not, however, universal. For the Eastern group of railways the increase over July, 1911, was 10.9 per cent., or $2.01 per mile of line per day; for the Western group 16.4 per cent., or $1.29 per mile of line per day. The net revenue of the Southern group decreased 5.5 per cent., or 41 cents per mile of line per day.

Taking the average per mile of line for the month for the country as a whole, total operating revenues increased $89 or 8.7 per cent.; operating expenses increased $53 or 7.6 per cent.; while net operating revenue increased $35.89 or 11 per cent. Taxes amounted to $45 per mile of line, an increase of 8.5 per cent.

The aggregate of all net operating revenue for the month was $80,197,743, an aggregate increase of $9,037,016. This net operating revenue per mile of line for the seven months of the calendar year continues less than for the corresponding seven months of 1911. Net operating revenue is the amount available for taxes, rentals, interest on bonds, appropriations for betterments and dividends.

BLOW HOLES IN BRASS CASTINGS

THE presence of blowholes in brass or bronze castings is the greatest difficulty encountered in the casting of these metals in sand. According to an English inventor, it may be prevented by casting the metal in a vacuum. The formation of these blowholes is prevented, he says, by making a system of minute passages or vents on the molding sand, sufficient to allow the air or gas to escape, but not the metal, and communicating with a large vacuum chamber, by means of which the air and gases may be withdrawn from the mold during casting. The mold is suitably enclosed, the molten metal being introduced from a vessel rotatably mounted upon it, while the vacuum chamber is provided with a trap for preventing the ignition of explosive gases which may be withdrawn from the mold.

Saskatoon, Sask.—The management of the Metal Shingle and Siding Co., of Preston, Ont ., will erect a branch factory in this city. It is reported that the cost will be $100,000.

STARRETT TOOLS

Duplicate Parts

are never right unless the original is within the allowable limits.

Users of Starrett Micrometers

make duplicate parts with the full assurance that their originals are right, because the Starrett Micrometer is right when new and is easily made accurate if worn ever so little.

The anvil is fixed—not movable as in other micrometers—possible wear is taken up by moving the adjustable sleeve with a spanner wrench.

Our micrometers are graduated in either Metric or English systems.

They read to 1-100 millimeter or 1-10,000 inch.

Full line illustrated in Catalogue 193.

Send for it.

SLOCOMB MICROMETER SET No. 20

0 to 12 inches

Consists of twelve Micrometers, one each, 1 to 12 inches, giving a range from 0 to 12 inches inclusive. Each micrometer is graduated to read in thousandths of an inch. Also 12 end measures from 1 to 12 inches inclusive. Rack has cast iron ends, black enameled finish, and cross pieces are well finished oak boards.

This makes an ideal assortment for the Tool Room.

THERE ARE OTHER ASSORTMENTS

of 3, 6 and 12 Micrometers, and if you are in need of any assortment of micrometers, you can't afford not to investigate these. In them you get the long bearing for screw—the larger diameter of screw—the solidly inserted anvil—the I section frame and several other features that are worthy of your consideration.

EFFICIENCY

Is the main consideration in your Power Plant. There is only one way to obtain it, and that is:—

BUY THE BEST

equipment you possibly can and DEVELOP YOUR OWN POWER. By so doing you save money and in addition you have a steady service all the time. The Power is not off just when you need it the worst. Such service means EFFICIENCY.

ELECTRIC WELDING

Cheaper, better, and faster than riveting

No. 126 Welder—Gear Box Drive

A belt-driven Spot Welder—Simple and easy to operate.

¶ From 90 to 150 Welds per minute.
¶ Six changes of speed by means of the gear box.
¶ Touch the foot treadle and the upper welding die moves up and down: the same as a needle in a sewing machine.
¶ The electric current is automatically turned on and off. One weld or any number of welds can be made.
¶ But—this is only one type out of nearly a hundred kinds of welders we make. Our free bulletins tell all about them.
¶ And don't forget that

"TALKATIVE CUTLER"

will be at the big Boston Electric Show, in Booth 309, from September 28th to October 26th. He'll tell you all about welders (if you'll give him half a chance), and if you jolly him a little—he will weld a souvenir for you.

NO LEASE. NO LICENSE. NO ROYALTY.

Mr. Manufacturer:

You want your machinery repairs done in a thoroughly competent manner—with the smallest possible delay—at the minimum of cost, and we are specially well equipped to handle your work.

THIRTY YEARS' EXPERIENCE is the record of the heads of our mechanical staff—thirty years spent in a careful study of ways and means to eliminate **unnecessary labor and expense** in handling machinery repairs.

The rapid growth of our repair department during the last few years is a standing testimony to the satisfaction our work is giving and to the fairness of our charges.

Ask us to send an expert repair man to investigate your repair troubles and to give you any helpful advice and suggestions within his knowledge. This will cost you nothing, nor will it obligate you in any way.

Our policy is never to lose a customer once on our books, and we can prove our claims by your giving us a trial.

MORSE

TOOLS FOR AUTOMOBILE WORK

The Machinists' Tools made by the Morse Twist Drill and Machine Co., which have proved so popular for many, many years, have again made good with Automobile Manufacturers.

These tools comprise Drills of various kinds for use in steel, iron and wood, of Carbon and High Speed Steel; Taper Pin Reamers for reaming holes to fit Morse Taper Pins. (These Taper Pins are correct as to taper—¼-inch to the foot—and size; are made of selected stock, highly polished and finely finished.) Other Reamers especially adapted for Auto work are Jobbers, Shell and Expansion Reamers. Then there are Taps of A.L.A.M. Standard and Gear Cutters.

The tools mentioned are indispensable in the making and repairing of Automobiles. They have given long and satisfactory service and have always proved their economy and value. Every manufacturing plant and repair shop should be equipped with them.

A 350-page Catalogue illustrating and describing all the lines made by the Morse Company will be sent to anyone free of charge.

MORSE" Drills and Tools are handled by :—Rice Lewis & Son, Limited, Toronto; Aikenhead Hardware, Limited, Toronto; Frothingham & Workman, Montreal; Mechanics Supply Co., Quebec.

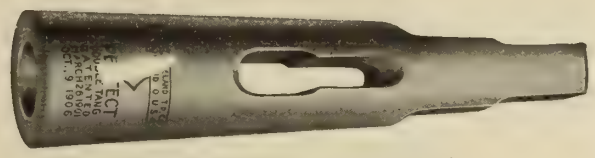
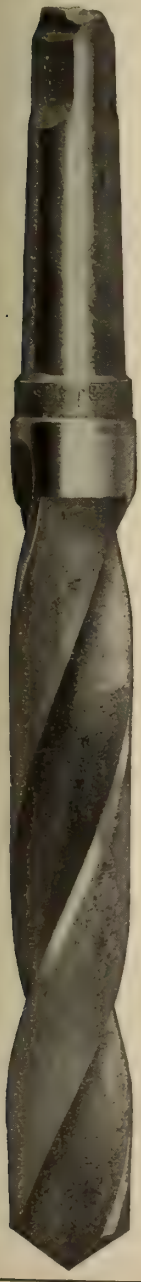
STOP THAT WASTE!

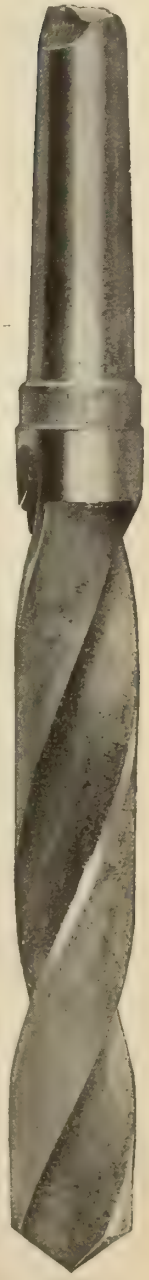
The new tang is .500 inches in thickness.



The broken tang was only .312 inches in thickness.

(Pat. March 1901; October 1906)





"PERFECT Double Tang" SOCKETS

fit any spindle having a regular taper hole. They not only make it possible to *put your tools with broken tangs in use again,* but they also *give you the full life of every tool once fitted to them.*

Three minutes' grinding puts a new tang on the taper shank below the old one. It is stronger than the old one, being from 25% to 60% thicker, according to the size of the shank. It will last through the life of the drill. When you have reclaimed your scrap heap in this way and begin to use double-tang drills in "Perfect Double-Tang" Sockets, you will *end your tang troubles for all time.*

"Cleveland" Drills and Reamers will be furnished with double-tangs to fit "Perfect Double-Tang" Sockets at the same price as regular tools.

Write for Circular No. 18-C.

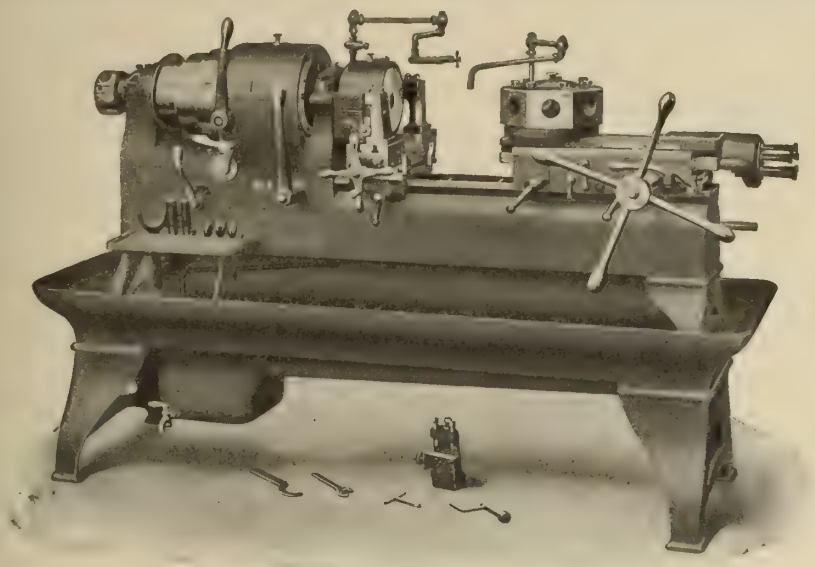
Every Lever Within Easy Grasp

Yet so arranged that it is difficult to become confused in operating machine.



No. 6 Wire Feed Screw Machine.

The centralization of controlling levers at a point where they can be most conveniently reached by the operator is an important advantage in the design of the NO. 6 WIRE FEED SCREW MACHINE.

Convenience is very essential in wire feed screw machine construction, as it governs the rapidity with which the operator can make the necessary movements to control the machine.

Without changing his position and, with one hand for manipulating the cross or turret slide, the workman with the other can set the machine for any feed, throw the back gears in or out, regulate the speed, and open the chuck to feed stock.

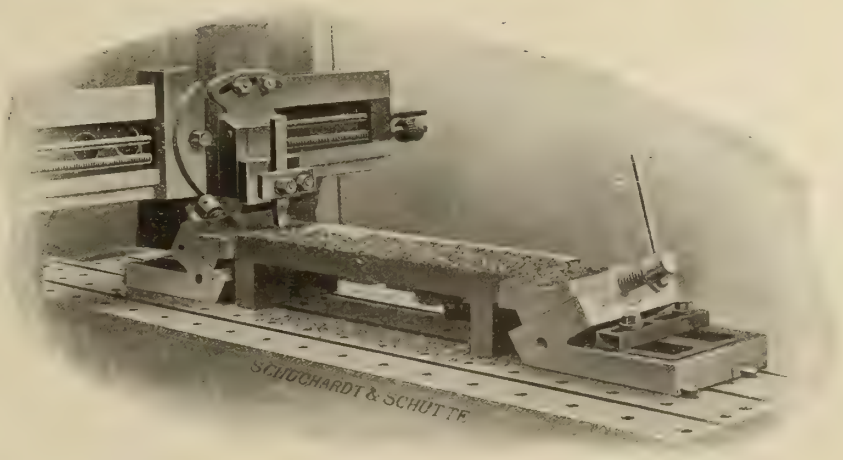
Handiness is only one feature of our wire feed screw machine. Let us send you special circulars describing others.

Brown & Sharpe Mfg. Co., Providence, R.I., U.S.A.

Selling Agents: THE CANADIAN FAIRBANKS-MORSE CO., LIMITED, Montreal, Toronto, Winnipeg, Calgary, Vancouver, St. John.

S & S Divided Machine Vises

Will hold work up to full length of table on which they are used.



Will Clamp the heaviest work as well as the lightest.

The Combined Parallel and downward movement of the jaw forces the jaw down to the table, saves the operator the use of a hammer, which with ordinary Vise is necessary to insure work being properly bedded to its supports.

Price is less than ordinary Vise. Made in three sizes.

Write for special catalogue.

Dixon Crucibles

EVERY crucible made by DIXON since 1827 has been made with the one idea of giving reliable service.

¶ In doing this nothing has been so helpful as our experience and our study of actual foundry conditions. ¶ In the purchase of raw material, in mixing it correctly, in spinning up the crucible, wherever there has been any question our experience has been called upon to give the final answer.

¶ Write for our booklet No. 223-A on the care and use of crucibles.

Joseph Dixon Crucible Company
Jersey City, N. J.

Which Journal do you use when in the market for Shop Equipment or Supplies?

THIS Directory is run every month at considerable expense for the benefit of our readers—*your* benefit.

¶ You will find listed practically every machine shop or foundry requirement, from twist drills to coach wheel lathes, and from foundry facings to cupolas.

¶ You will find under each heading from one to a dozen names of reliable firms anxious to furnish information for the asking.

¶ Turn from this directory to our advertising pages and study carefully what our advertisers say regarding their product.

¶ You do not derive half the possible benefit from any one issue of Canadian Machinery unless you study the advertising pages.

¶ The most progressive firms *believe* in advertising, and these are the firms who are constantly employing the best designers in order to keep their product thoroughly up-to-date.

¶ In his space, the man who is spending his life perfecting his product, tells you briefly about a few of the outstanding features. It is your privilege to write and get *complete* information, and that information is going to help you get better results.

Refer to Canadian Machinery Directory and Advertising pages---you will help us, the advertisers and yourself.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

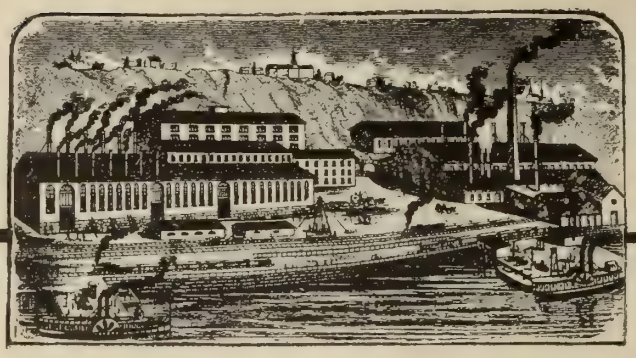
MARINE ENGINES and PUMPS. SHOE MACHINERY A Specialty



BRASS and IRON CASTINGS. BOILERS and REPAIRS.

That we have exceptional facilities at our disposal for the manufacture of all kinds of Machinery—in addition to our business as Brass and Iron Founders, General Contractors and Shoe Machinery Engineers—has been amply proved this year. In the short space of five months, we built and installed all the Engines and Boilers of the new sister steamers "Levis" and "Lauzon," whose trial trips were a complete success. We make a specialty of all kinds of Marine Engine Work, and shall be glad to quote for first-rate products only.

SHOE MACHINERY. Manufacturers of "Non-Royalty" Machines, Metallic and Goodyear, "Fortuna" Skivers, and "Climax" Presses, Sand-papering, Lasting and Loose Studding Machines.

Wire of every description for Slugger and Standard Screw Machines.

The Canadian General & Shoe Machinery Company, Ltd.

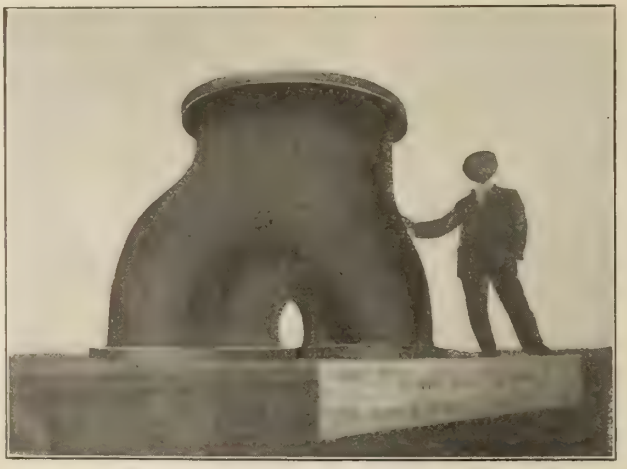
ERNEST CARON, Managing Director

LEVIS, Quebec

STEEL CASTINGS

Our castings are as perfect and efficient as castings can be, yet they can be procured at a price that will ensure economy.

Let us submit you estimates before placing your next order. Write to-day.



Casting for a 10,500 H.P. Water Wheel.

We make New Process Converter Steel Castings, annealed and unannealed.

We also make Chrome Manganese Nickel Steel Castings.

Made in any size from ¼ lb. to 3000 lbs. and **guaranteed right.**

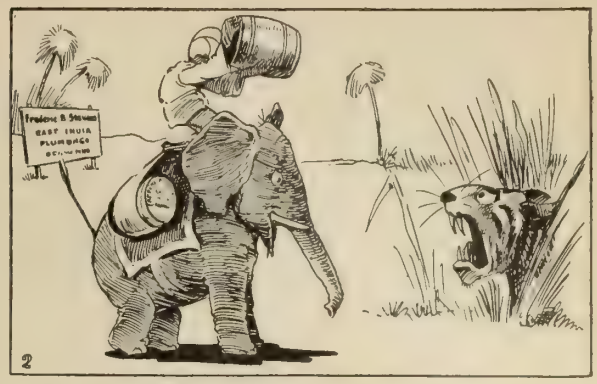
Not an Enterprise for the "Quitter"

"If there is one enterprise on earth," says John Wanamaker, "that a 'quitter' should leave severely alone, it is advertising. To make a success of advertising one must be prepared to stick like a barnacle on a boat's bottom.

"He must know before he begins it that he must spend money—lots of it.

"Somebody must tell him that he cannot hope to reap results commensurate with his expenditure early in the game.

"Advertising does not jerk; it pulls. It begins very gently at first, but the pull is steady. It increases day by day and year by year, until it exerts an irresistible power."



2

On the Defensive!

There are times when the Foundryman is on the defensive.

It is when the tiger of competition is too self-assertive.

In the reduction of costs a new profit is created.

Stevens' Pure Plumbago reduces cost

One New York Foundryman writes:—

"Your Lead gives me the best peeled castings I have had for a long time, and the color is right, too."

That means that this Lead does the work expected in the Foundry instead of leaving it for the scratch-room or the chipping room to finish.

That means labor saving and cost saving.

Each shipment has its return ticket—it may be returned and freight paid by me both ways when not satisfactory.

The entire risk is on me!

Its use squelches all tiger danger.

I manufacture the entire line of **Foundry Facings and Foundry Supplies**, and the quality stamp impresses them all.

DESCRIPTION

Length over all, 5 feet 6 inches.
Height to centre of shaft, 38 inches.
Weight, 375 lbs.
Length from end of spindles to tight collar, 7 inches.
Length of Spindles, 30 inches.
Diameter of Spindles, 1⅜ inches.
Diameter of Spindles for wheel, 1¼ inches.
Tight pulleys, 5¼ inches.
Loose pulleys, 5 inches.
Crucible steel spindles.
Bearings extra long and babbitted with Phoenix babbit metal.
All bearings carefully scraped.
With or without Shifter.
Slight extra changes to meet special requirements without extra charge.
Fitted with Compression Oil Cups.
Pulleys turned inside and out and carefully balanced.
Strong and durable and made for extra hard usage.
A strictly high-grade machine and fully guaranteed in every respect.

PROMPT SHIPMENT GUARANTEED.

Don't Waste Valuable Time--Don't keep part or whole of Your Plant Idle

While waiting for some renewal part of your machinery don't lose some good customers who are depending on you to fill their orders promptly.

WELD YOUR BREAKS BY

AUTOGENOUS WELDING

We sell and install complete welding and cutting plants or do the work ourselves, as you desire. When your next breakdown occurs, wire us. We have emergency repair outfits and night and day shifts for the benefit of our customers. These outfits travel by express, and will minimize your waits and make broken parts as strong and efficient as the original.

Any Machines Or Tools Damaged Or Broken?

Nothing too large or too small for Our Capacity

Our operators are expert and our equipment is the best that can be made.

Our prices are very low in comparison with the quality of our work. **If you have any broken part of machinery which YOU consider worth saving, send it to us** and test our work. We know you will be highly pleased with the results.

Keep us in mind. You will need us badly some day, and we can save you much money, time and trouble.

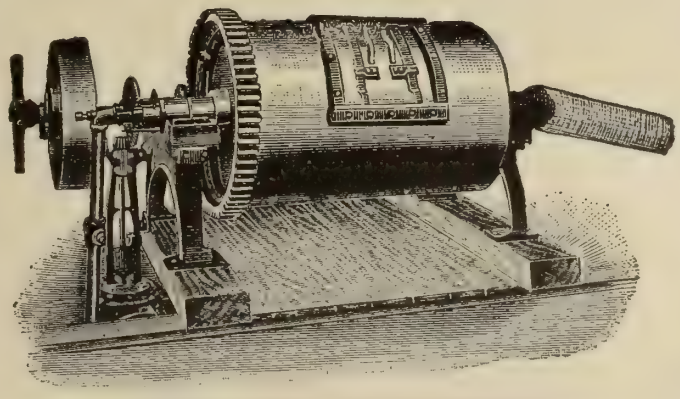
A GOLD MINE

SAVE YOUR IRON



SLY'S PATENT IRON CINDER MILL
Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the iron contained in your cupola dump and gangway scrapings and 75% of the coke. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

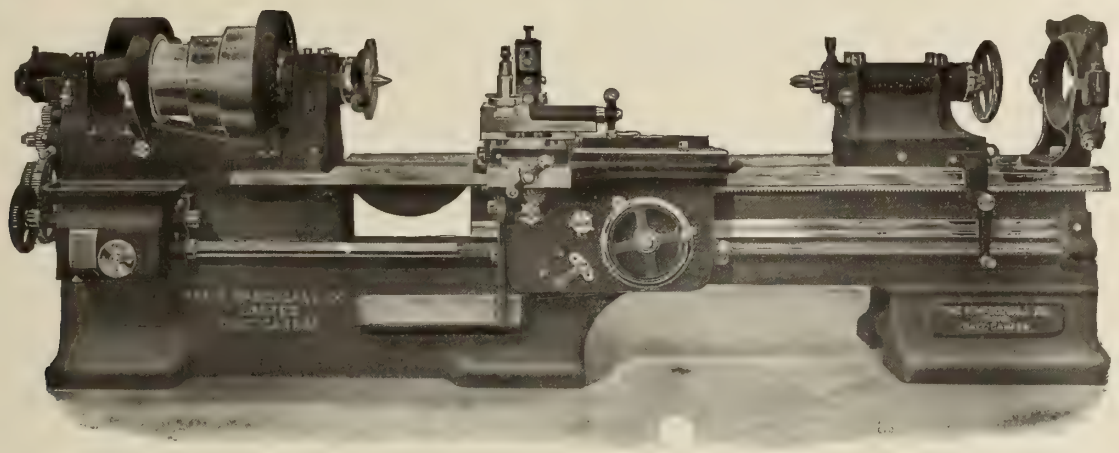
A McDougall Gap Lathe Can Always "Deliver the Goods"



HERE is equipment for your factory that always "delivers the goods" any way you measure the delivery.

If you place stress on clean smooth finishing of output, true to 1/1000 inch or less—the McDougall Lathe has the solid bed and solidly held tool that will turn out the work for you.

If by "delivering the goods" you lay stress on large daily output, the McDougall Gap Lathe has quick-locking sleeve device, easily-changed tailstock with top adjustment, micrometer readings both ways on the compound rest, and 18 spindle speeds to give the highest desirable cutting speed on the work being done—little time is needed for changes, nearly all the day's work is "cutting" time.

If by "delivering the goods" you mean years of service in your shop, with true headstock bearings, solid carriage, even and steady tool movement, and slow deterioration — this McDougall Gap Lathe has the quality of material, size of bearings and strength of design to keep in "shop condition" for many a year.

This wonderful lathe has the elasticity and ease of handling of a small lathe, with the power and reserve strength and capacity you seek for in a heavy-service tool.

Few or none among the lathes of this size have the quick adaptability of the McDougall Gap Lathe. The supported gap makes it as solid as a flat-bed lathe, and the removable bridge allows its use as a flat-bed or as a gap-machine. In effect the McDougall Gap Lathe is "two lathes in one."

As to the gap, note the capacity. It has both width and depth, enabling you to handle large parts in the gap. The whole tool is designed to give service to the limit of your needs.

We want you to instal one or more of these lathes. They are representative of equipment that every machine shop in the country should instal, because they are able to handle the widest possible range of work perfectly, and with a minimum of adjustment time and a maximum of productive money-earning time.

Write us. We have a variety of gap sizes. You have a choice of lengths of bed. The safety interlocking feeds protect the lathe against accident. The self-oiling grit-protected bearings protect against deterioration. The machine is solid throughout. Full particulars to those who want equipment that "delivers the goods."

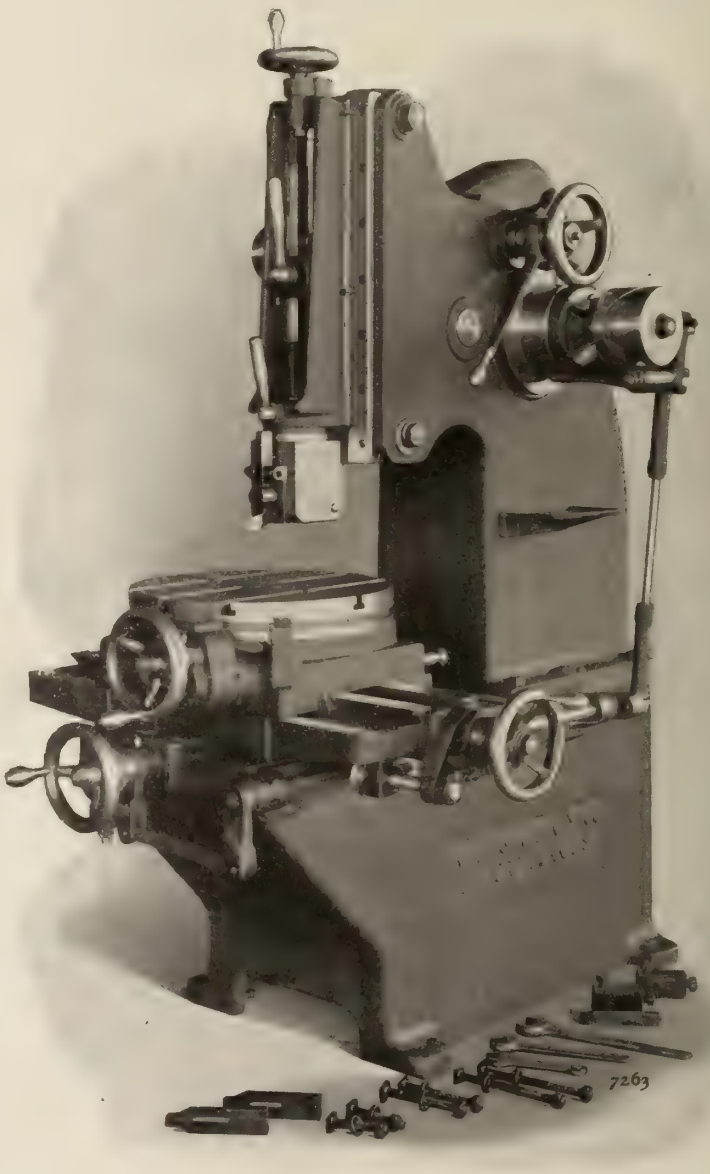
New Devices on P.&W. Vertical Shaper Add to Convenience of Operation

Clutch located within easy reach of operator enables him to start or stop the ram in any position.

New Ram Control

The lever on the right hand side of the upright operates a clutch for starting or stopping the ram in any position, entirely independent of the main driving belt or motor.

Hand adjustment of the ram has also been provided, controlled by the handwheel on the clutch shaft.



Feed Safety Device

A safety device, depending for its action on springs in the feed rod, has been introduced into the feeding mechanism. This feature does not in any way interfere with the positive character of the feed, but prevents damage in case of obstruction.

Many Other Valuable Features

1. Swiveling Ram Head for cutting at an angle, such as die clearances.

2. Tilting Ram permitting the completion of work at one setting.

3. Improved type of tool post eliminating the usual projecting set screw.

4. Quick Action Feed.

5. Vertical Construction.

Write for illustrated circular, "Vertical Shaper."

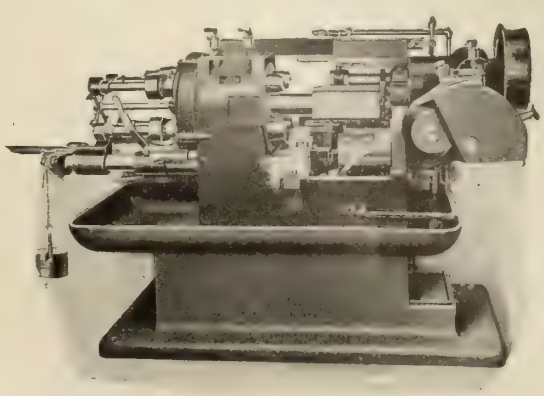
The Gridley Automatic

Write for Our DESCRIPTIVE CATALOG

It will give you an idea of the **many advantages** which prevail in **Gridley Automatics.**



"GRIDLEY" Multiple Spindle Automatic

The Turret Lathe That Differs from all others

Instead of clinging to the old-time box tools, which cause inaccuracy, due to a long overhang, the "GRIDLEY" clamps the tools directly to the face of the tool slide, where they rest firmly on what is practically an anvil base.

The "GRIDLEY" is simple in construction, and free from small parts, which make other automatics so complicated.

SAVES TIME AND LABOR

because **one** operator can attend to **several machines at once,** and can use tools tandem when rapid production is necessary.

We also manufacture the Gridley Automatic Turret Lathe—single spindle.

Maximum belt pull transmitted to the cutting tool.

THE BOYE & EMMES MACHINE TOOL COMPANY

Successors to SCHUMACHER & BOYE

Engine Lathes **CINCINNATI, OHIO, U.S.A.**

One Machine That Replaces Two Others and Does the Work of Either in Less Time

On all Face Plate Work Within Its Range

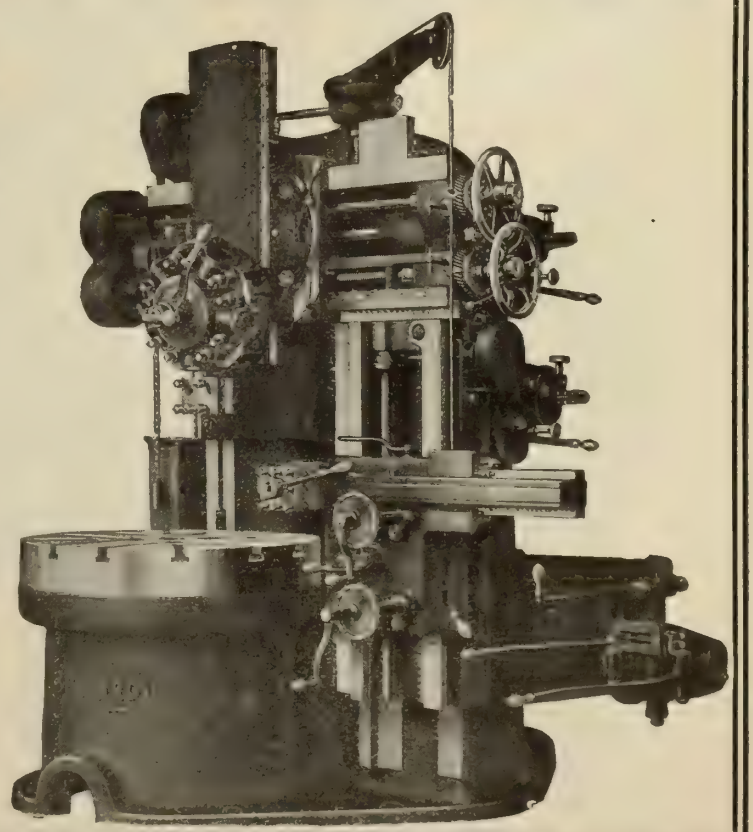
On all work within its range, the Vertical Turret Lathe replaces both the Vertical Boring and Turning Mill and the Horizontal Turning Lathe. It **combines** their good features. Thus it takes the place of either one of them with all the valuable features of the other **added.** But in combining the two, other features were developed which are exclusively the Vertical Turret Lathe's. Like a boring mill, it is heavy and rigid, capable of doing heavy cutting. Like the horizontal turret lathe, its turret provides a means of holding tools in instant readiness for a sequence of operations.

Unlike either of them, it has a Side Head for more tools, which can be brought into use simultaneously with those in the Main Head—Multi-cutting.

Unlike the horizontal machine, there is no overhang of the work—the alignment of table spindle is self-preserved.

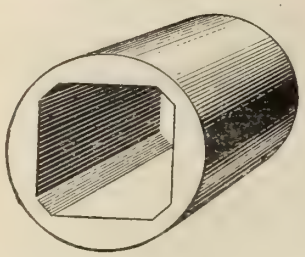
Unlike the boring mill, the **control is centralized**—time-wasting steps are eliminated. The similarities show that the Vertical Turret Lathe does all the work within its range, as well as **both** these machines.

Let us send you our interesting Treatise on Face Plate Work C-15—Free. It has the details.

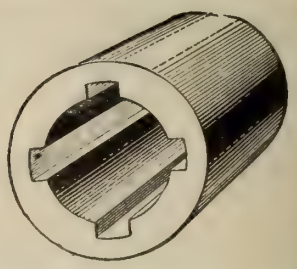


The Bullard Machine Tool Co.

BRIDGEPORT, CONN., U.S.A.



Broaching Samples
AND THE MACHINE
That Broaches Them

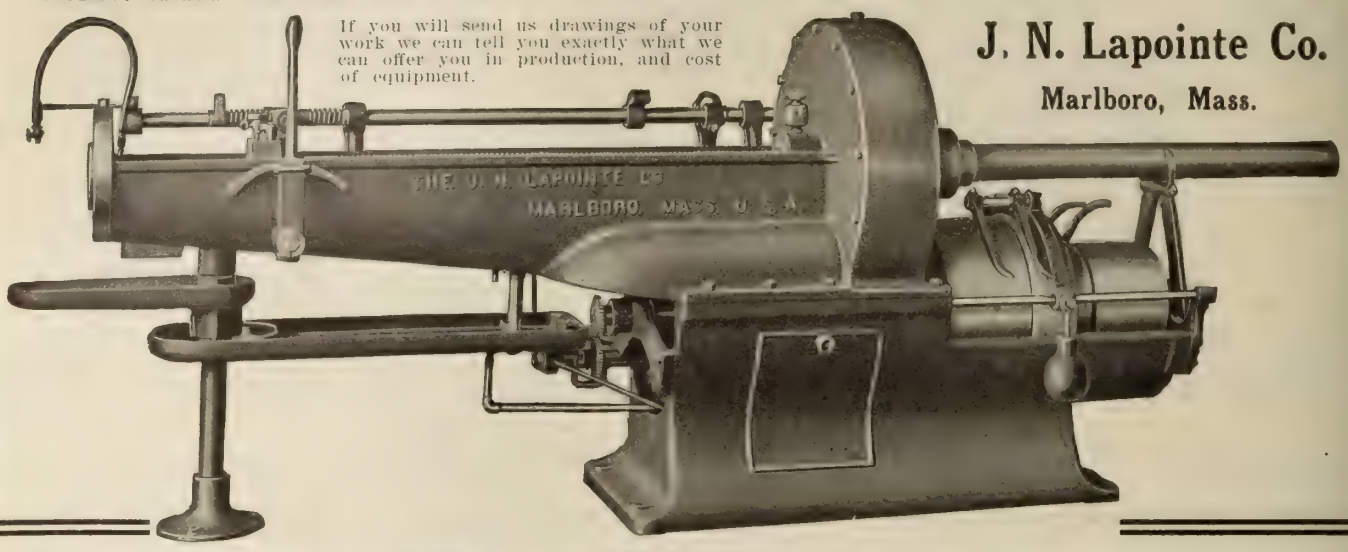


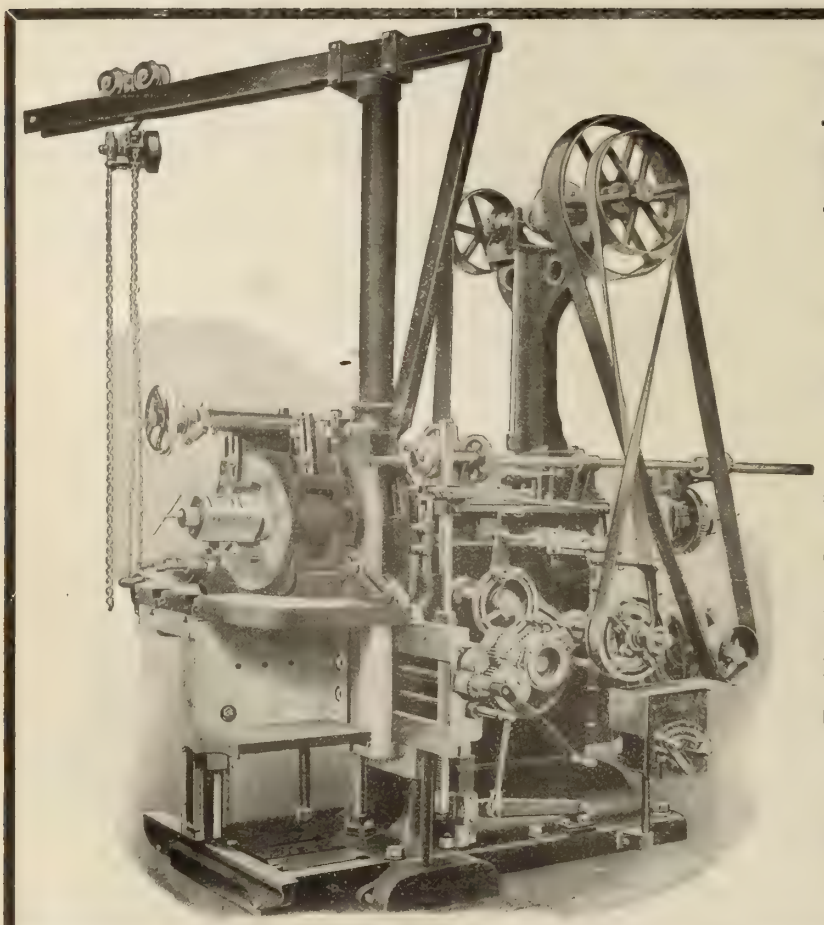
Every Progressive Machine Shop Will Benefit By Its Service

Canadian manufacturers who are not familiar with the advantages of our Broaching Machine should make it a point to get acquainted at once.
It is **adapted for broaching square, hexagon, rectangular or any shaped hole.** Also the most rapid and accurate for cutting ordinary keyways in holes.
Hundreds of manufacturers in the States, as well as abroad, are using our machine and find it most profitable. Why shouldn't Canadian manufacturers find it the same?

If you will send us drawings of your work we can tell you exactly what we can offer you in production, and cost of equipment.

J. N. Lapointe Co.
Marlboro, Mass.





The Morton Draw-Cut
RAILROAD SHAPER

Built especially for the work.

Slots the Crown and Cellar fits in Axle Boxes better and quicker than a Slotter.

Planes the Brass Crown Bearing or Shell to fit.

Planes Shoes and Wedges, Rod Brasses, and is well adapted to general work.

Built in one size only—thirty-two inch stroke. Send for Bulletin No. 6.

We also build Standard Pillar Shapers of 26 to 30-in. stroke. Bulletins Nos. 4 and 5.

Special Shapers for Frog and Crossing work, Bulletin No. 10, and Locomotive Cylinder Planers with full equipment, Bulletin No. 7.

Built by the Draw-Cut Specialists.

The Morton Manufacturing Company
MUSKEGON HEIGHTS, MICH.

Much of the milling in most shops is not heavy cutting.

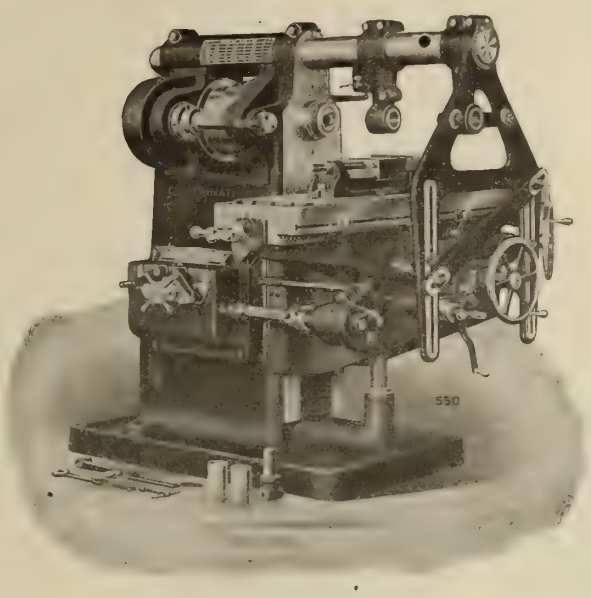
On this work the very powerful single pulley millers do not increase production.

An up-to-date, properly designed, cone-driven machine like our No. 4 Horizontal often proves the better investment.

It is our "High Power" Miller with cone-driven spindle.

We have simply replaced the Single Pulley, geared Spindle Drive Box with a Double Back Geared Cone of large diameter.

It has ample power for all that work requiring a large machine, but not excessively heavy cutting. It can be depended upon for long, hard, continuous service, because of its massive "High Power" construction.



Its maintenance cost is low because of its simplicity.

AND IT IS HANDY.

The Feed Changers and Back Gear Lever are where the operator stands to shift the belt.

The Table always feeds in the direction in which the Engaging Lever is set.

This same lever also reverses the feed.

All Controlling Levers are at the front of the knee and saddle. So is the Quick Return.

Everything that has to do with its operation is within easy reach.

And there is an additional lever at the side of the knee controlling the feeds from behind the table, for end-milling or boring or similar work which can't be successfully done when the operator stands in front, as he must do on all other Millers.

Let Us Help On Your Milling Problems

We make the largest variety of machines and therefore can recommend the ones best suited for your work.

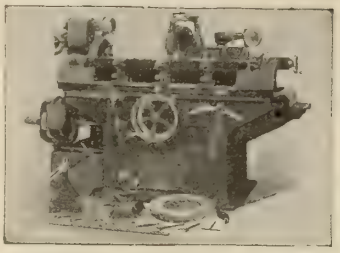
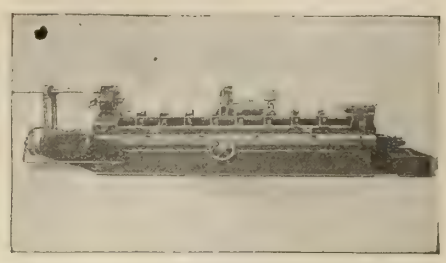
LANDIS PRECISION GRINDING MACHINES



Landis Plain Grinding Machines .

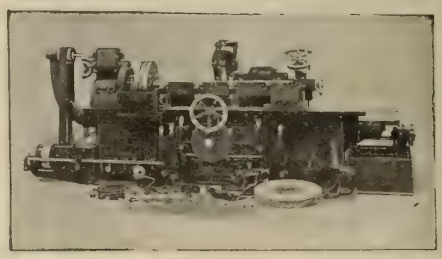
10" x 30", 12 x 32", 12" x 42", 12" x 66", 12" x 96", 12" x 120", 16" x 72", 20" x 96", 20" x 120", 20" x 144", 20" x 168". These machines are intended for finishing straight and taper spindles, shafts, rolls, tubing and all other work within their range which can be revolved on dead centres.



Large Type.

Standard sizes: 20" x 96", 20" x 120", 20" x 144", 20" x 168".

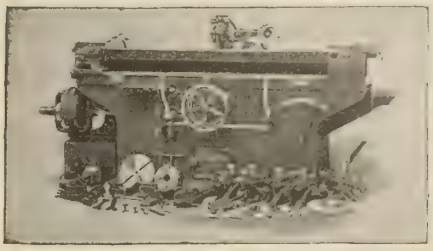
These manufacturing machines are adapted for straight and taper cylindrical shafts, spindles, pistons, corliss valves, plungers, tubing, and are especially desirable for grinding hardened steel and iron rolls.



Plain Grinding Machine with Gap.

These are our 16" Plain Machines built with gap in the bed to suit the location of the projection on the work.

Largest exclusive manufacturers of grinding machines in the world.

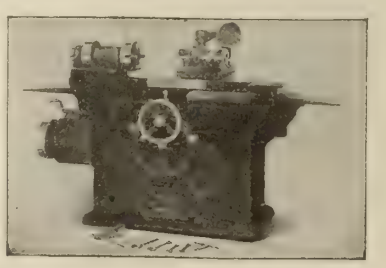


Landis Universal Machines (Large Type).

No. 1 (10" x 20"), No. 1½ (10" x 30"), No. 2 (12" x 32"), No. 3 (12" x 42"), No. 4 (12" x 66").

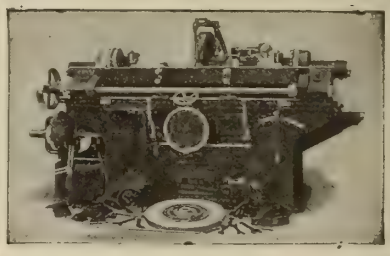
Nos. 2, 3, 4 (also built with 16" swing) are used for finishing tools and a variety of straight or taper parts (both external and internal) as are common to the toolroom, machine shop, railroad shop, etc.

Attachments such as magnetic chuck, gear cutter attachments, cam grinding attachment, side mill grinding attachment, etc., can be used on these machines.



Landis Internal Grinding Machines.

This machine is intended for straight and taper internal grinding. The fixtures for these machines will grind holes ¼" diameter or larger, and up to 12" long.



Landis Crank Grinding Machines.

These machines are designed for grinding single or multiple throw crank shafts used in gas and small steam engines.

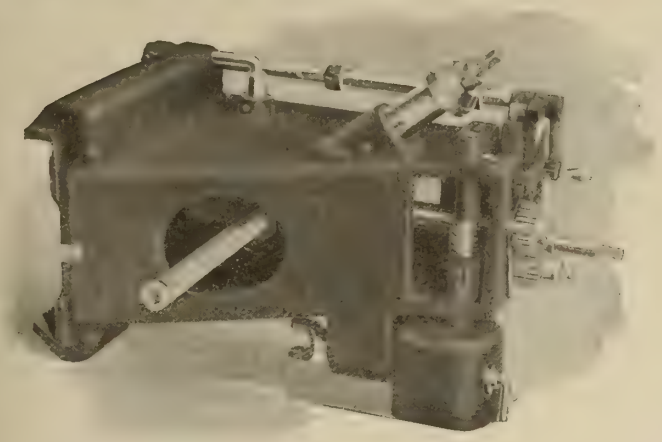
The Chuck for Holding Thin Bushings Without Distorting Them

Does easily what it is difficult to do with a three-jaw chuck.
Can be attached quickly to the nose of the work spindle of the HEALD GRINDING MACHINES. Is easy and rapid to operate, and locates the bushing so that only a small amount of stock need be removed to obtain a round hole.
Maximum capacity, 4 in. diameter by 4½ in. long, and will handle different sizes of work that otherwise would require several chucks.

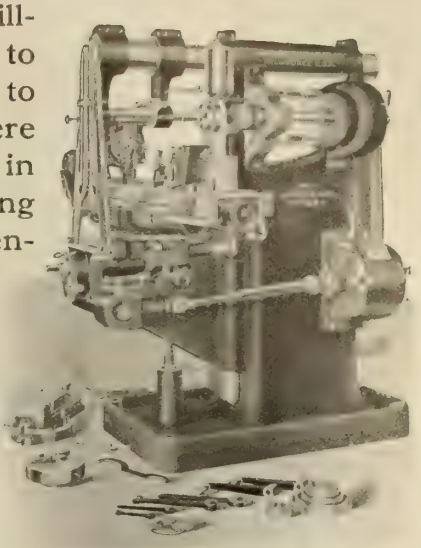
This fixture fully described in our booklet, "PRACTICAL HINTS ON INTERNAL GRINDING," pages 18 and 19, which will be gladly sent on request.

THE HEALD MACHINE COMPANY

8 New Bond Street **Worcester, Mass.**



The KEMPSMITH MASSIVE KNEE



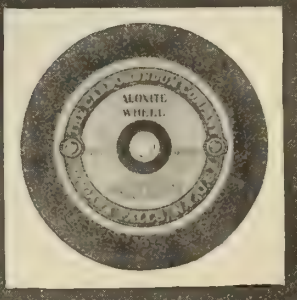
helps the milling machine to ***stand up*** to steady, severe service in manufacturing milling. Generous proportions, with abundance of metal thrown where it is most needed—for instance, around the bearings on the column. See also the length of these bearings. The whole machine is built along the same massive lines.

Built in "The Model Plant for Specialized Machine Manufacture."

THE KEMPSMITH MFG. CO., MILWAUKEE, WIS.

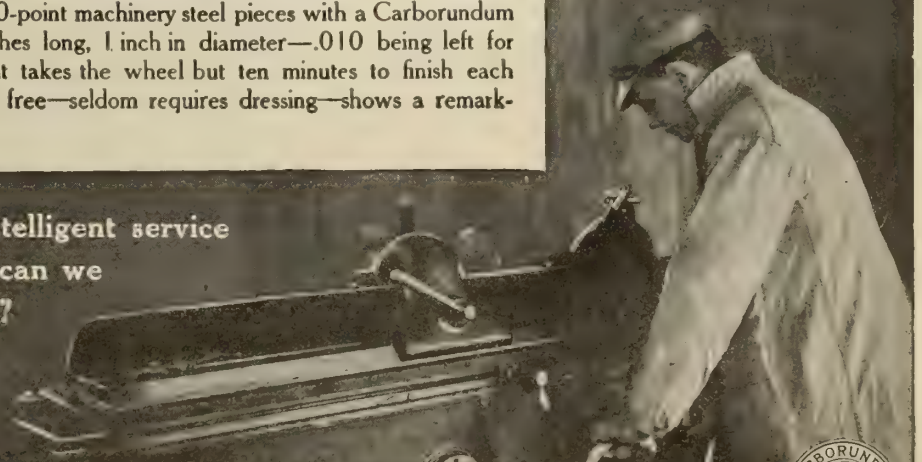
Canadian Agents: National Machy. & Supply Co., Hamilton, Ont. Canada Machinery Agency, Montreal, Que.

IT'S GRINDING KNOWLEDGE



THE ability to give the right Wheel—right Grit—right Grade—in the right place—and then advising how to get the best and the most out of that wheel—that makes our Service Bureau valuable to users of Carborundum and Aloxite Wheels.

Every day our grinding experts are helping manufacturers to get full efficiency and economy out of their grinding departments—as an instance: In a Vermont plant they grind 30-point machinery steel pieces with a Carborundum Wheel.—The pieces are 8 inches long, 1 inch in diameter—.010 being left for grinding after rough turning—it takes the wheel but ten minutes to finish each piece—the wheel cuts fast and free—seldom requires dressing—shows a remarkably long life.



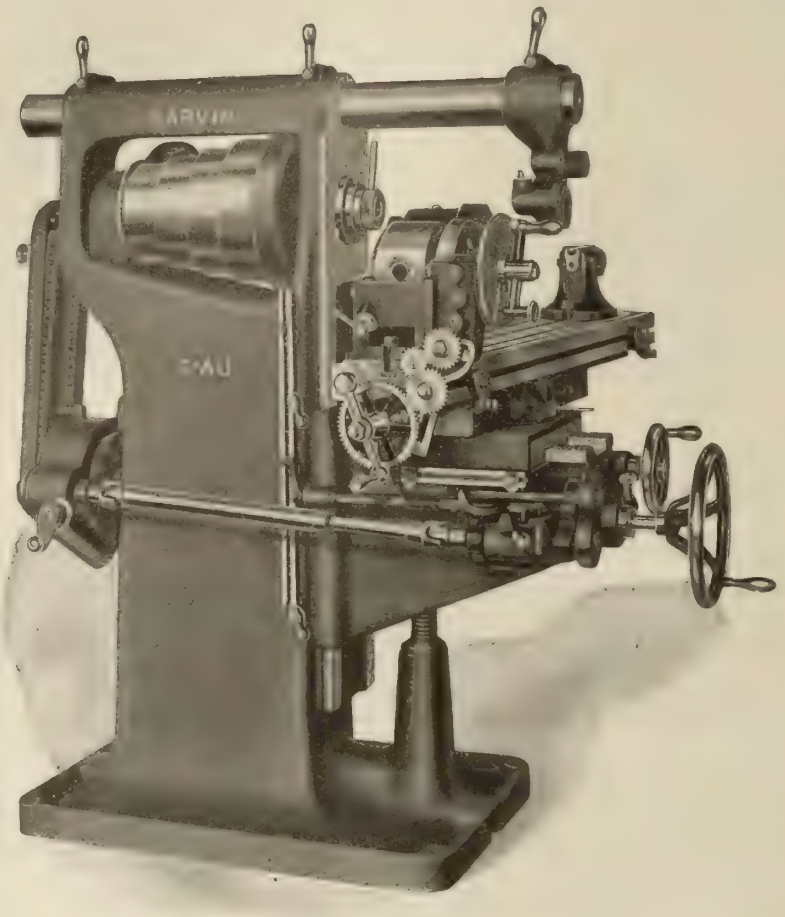
Efficient wheels plus intelligent service bring results—can we help you?

THE CARBORUNDUM COMPANY, Niagara Falls, N. Y.

New York Chicago Philadelphia Pittsburgh Cincinnati Cleveland Milwaukee London, Eng.

GARVIN No. 2-A (ALL FEEDS) Universal Milling Machine

IS THE MACHINE FOR YOUR TOOL-ROOM——RIGID AND ACCURATE



GARVIN NO. 2-A Universal Milling Machine
(Automatic Feeds in all Directions)
Use Code - - - - ANIMUS

Power Feed with reverse and automatic trip is provided in all directions, table, in and out and up and down. The feed movements are all controlled by one handle with which the knee, saddle or slide can be started, stopped and reversed. The table has an independent trip handle in addition.

Ten positive Feed Gear Changes are secured, doubled to twenty when back-gears are used. The accelerated feed of table is received, when large diameter cutters are being used and the spindle is running slow. The Feed can be changed while machine is in cut.

Machine is equipped with our Double Geared Dividing Head, our

SOLID TOP EXTENDED (Patented) KNEE

and many other valuable features exclusive to GARVIN Milling Machines.

DIMENSIONS.

Automatic Table Feed	25 in.
Automatic Feed of Saddle	8 in.
Automatic Feed of Knee	18 in.
Dimensions of Table over all	48x9 in
Taper Hole in Spindle B. & S (Positive drive)	No. 10
Width of Belt required	3 in.
Number of Speed Changes	16
Number of Feed Changes	20
Floor Space required	74x84 in
Crated Weight	3,500 lbs.

Doing It The Right Way
At the Rate of 210 per Hour

Here is a good example of manufacturing economy, brought about by substituting an improved Gardner Disc Grinder for the old-time methods. This particular illustration represents an increased output of 5 to 1, and a fifty per cent. better job than was accomplished by former machining process.
You know what a gas burner is as used on the ordinary gas range for cooking. It is merely required to face off the circular ends of these pieces straight and clean for an air adjusting cap. A very simple fixture, mounted on our Lever Feed Table, holds the piece while being ground. With unskilled labor these pieces are Gardner Ground at the rate of 210 per hour.

We do not claim Gardner Grinders will do everything, but we do claim there are innumerable pieces now being finished on shapers, milling machines, lathes, planers and precision grinders, that can be Gardner Ground with equal or superior accuracy, 3 to 30 times faster than they can be finished on the machines above mentioned.

Make us prove this statement by grinding some of your samples—free of charge. Our free 26-page Booklet of Tests contains much valuable data.

Gardner Machine Company

The Disc Grinding Authorities

BELOIT **WISCONSIN**

"*Detroit*" *Twist Drills*

Trade Mark

Scientific Standards

govern every modern, scientifically managed shop and factory. The exacting requirements of these standards are the measure of the excellence of every process in the making of "Detroit" Drills and other small tools. Modern methods demand Accuracy, High Efficiency, Length of Service. "Detroit" Drills are made to meet Twentieth Century Standards.

Every detail of their making receives the most exacting care, and accuracy characterizes every process. "Detroit" Drills are ground to the one two-thousandth of an inch ; the lip angles are equal, which means that both lips cut all the time ; the web is central ; the grooves milled with precision.

Our trade-mark guarantees every "Detroit" Drill to be as nearly perfect as human skill, scientific equipment, technical knowledge, 26 years of experience, repeated tests and continuous supervision can produce.

"Detroit" Twist Drills

Save Time
Wear the Longest
Reduce Shop Costs
Require the Least Regrinding
Retain the Proper Hardness and Toughness
Cut the Most Metal at the Highest Speed

Test them out. Get some on trial from your dealer. Prove to your satisfaction—AND PROFIT—that they do what drills must do in your plant.

"Detroit" Drills and other small tools are carried by Dealers everywhere, and are sold under an absolute guarantee. Today, now, write for Catalogue "R."

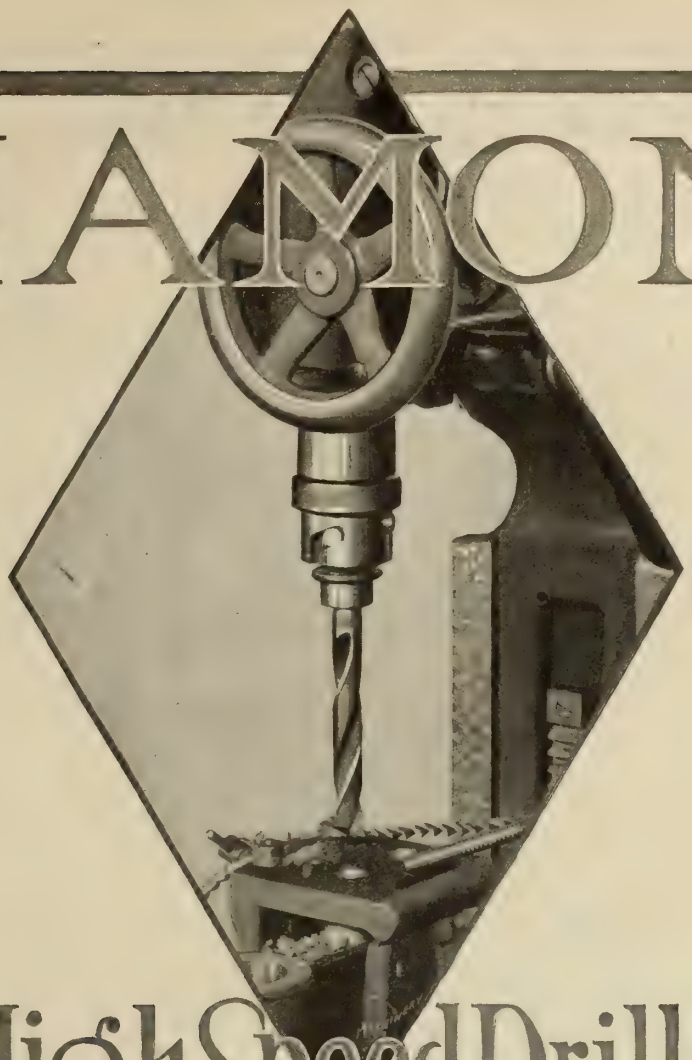
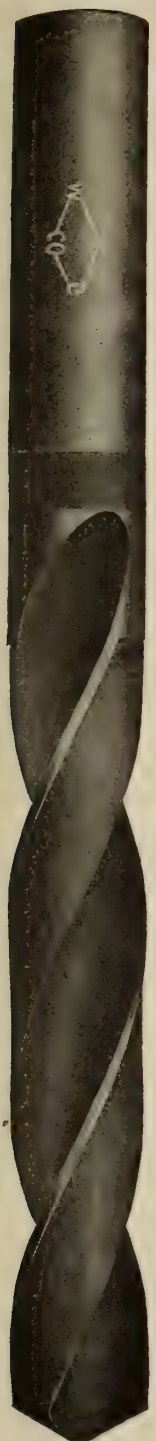
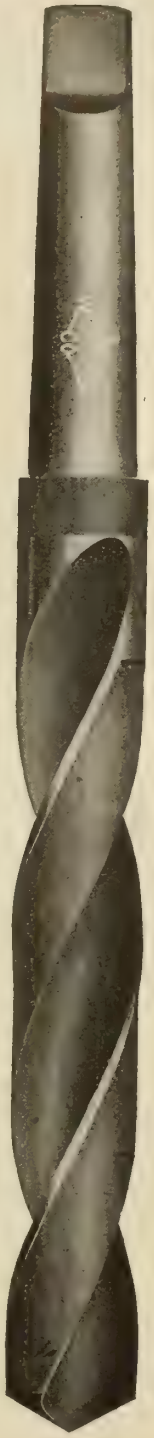
DIAMOND







High Speed Drills

Ever watch a modern, heavy duty, high speed drilling machine at work? Stand and marvel at the size of the hole and the speed and ease with which it is drilled?

The wonder of it all is not the immense power of the machine, but the capacity of a little piece of shaped and tempered and ground steel—a twist drill—to utilize that great power to force a way through the hard, tough metals.

Diamond High Speed Drills have these capacities highly developed. They cut well—and cut fast. They are durable and tough of grain—hard to break. They are all a Twist Drill should be in *Quality, Strength, Toughness* and *Endurance.*

Jobbers in all large cities will supply, or write us.

The "KEYSTONE"

PORTABLE LAMP GUARD Is Made For "HEAVY DUTY"

There's nothing flimsy or breakable about the KEYSTONE. It's a sturdy, serviceable guard, with malleable iron castings, bessemer steel ribs solidly locked together, and a man's-size, kiln-dried maple handle.

The socket is sunk, and can be quickly removed to make connections *inside the handle,* where there is room to knot the cord so as to take all the strain and prevent loosening the connections and short circuiting.

The malleable hook will bear a man's weight, so that he can support himself where necessary and hold the light with the one hand, or use the hook to reach and lift heavy parts.

Made in 16 c.p. and 32 c.p. sizes. Insulation perfect up to 600 volts.

High Speed Steel Has a Solid Foundation In a Name That Means Something

Cutting speed attained on cast iron: Roughing cut, 140 ft. per minute—finishing cut, 210 ft. per minute.

In NOVO SUPERIOR you secure a materially increased speed over the high speed steels now in use, the highest quality, greatest toughness, longest life (3 times that of any other) and exceptional ability to cut very hard materials. The cutting edge retains its sharpness from 3 to 4 times longer than other high speed steels. Hardens in oil, air or water, and is now carried in stock in our warehouse in all current sizes, flat, squares and rounds; annealed and unannealed.

GANG DRILLS

THE ROCKFORD DRILLING MACHINE Co. · ROCKFORD · ILL., U.S.A.

Are Really Vertical Lathes, but their Value Lies in their Ability to use the Operator's Time to Greatest Advantage

Every second spent by an operator hanging on to a lever or waiting for the power feed to run through the cut is a second wasted. With a view to overcome this loss we have designed machines so as to take up all the operator's time and increase output.

Rockford Drilling Machines are machines of versatility, elasticity and practical economy in manufacturing equipment.

The Gang Drill can be made one of the **most valuable machines in your shop. The secret is in the proper** jigging and tooling of the drill, gauging the number of spindles per operator to the time required for the longest operation, and the loading and unloading of pieces.

Our booklet, "Jigging and Tooling," will give you full particulars. Write us at once. **You CAN increase your output at minimum labor cost.**

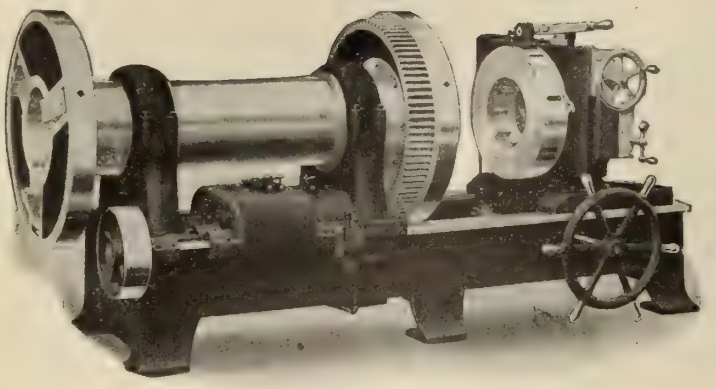
ROCKFORD DRILLING MACHINE CO.
ROCKFORD, ILLINOIS, U. S. A.

THREAD CUTTING MADE EASY



Do you know that with a Bignall & Keeler Improved Pipe Machine you can always get good threads with less power, less worry, and in quickest time? The threading adjustments are so simple, quick and accurate that merely turning the adjusting nut sets the dies instantly for threads of different gauges. The dies are quickly and easily withdrawn.

EVERY USER REALIZES THE SUPERIORITY OF THE

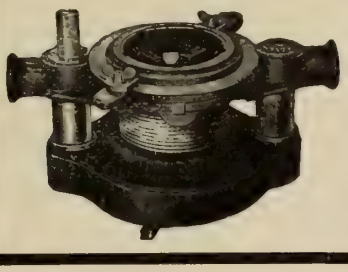
"BEAVER" ADJUSTABLE

Die Stock

THE BEAVER

It works quicker, easier and more accurately than others. Experience and service have proved it.

Besides, it contains a set of dies that can be adjusted with a twist of the wrist, so as to thread four different sizes of pipe. It requires less up-keep expense than other makes, as it eliminates the buying of three die sets.



It will pay you to get acquainted. Write us at once for circulars and prices.

Why not equip your foundry with light TRAVELERS, HOISTS AND TROLLEYS? They will make dollars for you just the same as they have for others.

And when you decide to do it, don't forget, that WRIGHT'S STEEL HOISTS are the most perfect for foundry work.

The STEEL PARTS make them safe.

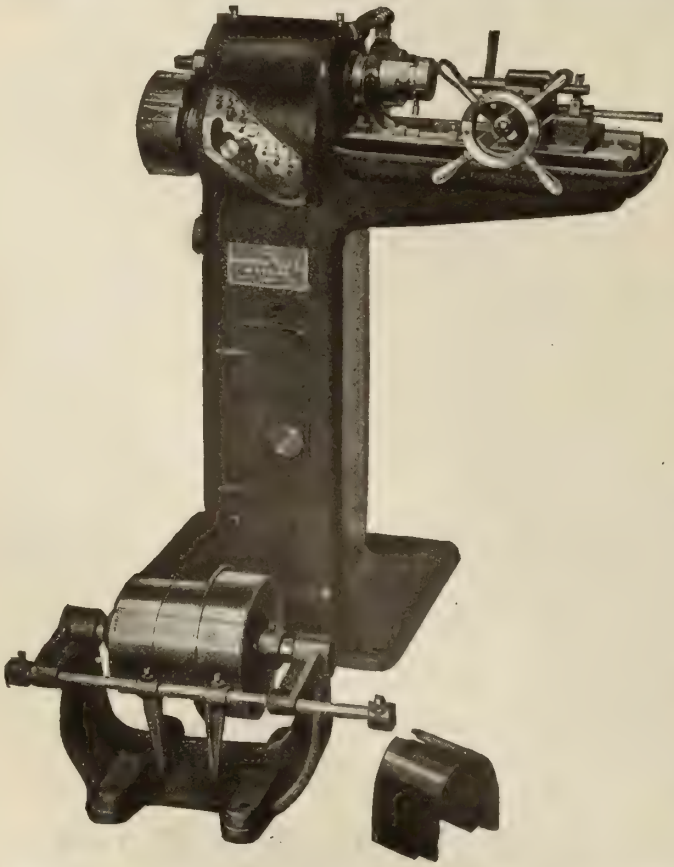
The workmanship makes them run smooth and easy.

Our QUICK LIFT is a wonder.

Sizes 2 ton and under have single load chain.
Send for catalog and prices.

Wright Manufacturing Co.

LISBON, OHIO. U.S.A.



The Geometric Threading Machine

is turning out a large amount of screw threads —work that cannot be done to advantage on the usual screw machine, and work that cannot be done satisfactorily in any other way.

The Die Head with which this machine is regularly fitted has a range of cutting from one-quarter inch to three-quarter inch diameters inclusive.

Where fine pitch threads are to be cut on larger diameters, the machine can be fitted with a Die Head to take care of the work.

The chasers, from time to time, can be renewed at slight cost as they become worn.

Do not confuse our Machine with the usual Bolt Threading Machine.

Send for Descriptive Booklet.

This INGERSOLL-RAND Chipper in Your Shop!

What Does it Mean?

It means an expenditure of 1-10 of a cent every minute it's in operation.

It means continuous and reliable service.

It means at least 500 per cent. increase in a man's efficiency at chipping.

It means better and more uniform work.

One of these tools would undoubtedly increase your production and would pay for itself in less than two months.

Put one in **your** shop and get the benefit of these advantages.

SLOCOMB MICROMETER SET No. 20
0 to 12 inches

Consists of twelve Micrometers, one each, 1 to 12 inches, giving a range from 0 to 12 inches inclusive. Each micrometer is graduated to read in thousandths of an inch. Also 12 end measures from 1 to 12 inches inclusive. Rack has cast iron ends, black enameled finish, and cross pieces are well finished oak boards.

This makes an ideal assortment for the Tool Room.

THERE ARE OTHER ASSORTMENTS

of 3, 6 and 12 Micrometers, and if you are in need of any assortment of micrometers, you can't afford not to investigate these. In them you get the long bearing for screw—the larger diameter of screw—the solidly inserted anvil—the I section frame and several other features that are worthy of your consideration.

REDUCE METAL
WITHOUT WEAKENING IT

Our Book "The Modern Art of Swaging" sent free on request.

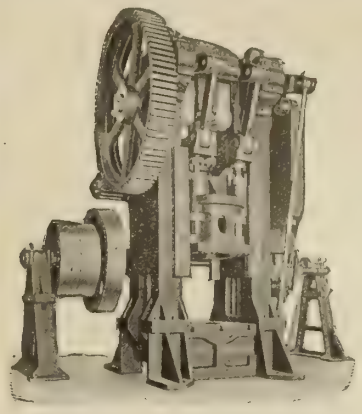
Swage The Dayton Way

The Dayton Swaging Machine does not sacrifice one particle of strength of the metal being reduced. From 2,000 to 6,000 taps per minute knead or squeeze all of the desirable quantities into the portion where its diameter is reduced. Thus the metal has added strength, solidity, rigidity, elasticity and uniformity. Swaging is far superior to rolling, grinding, milling, turning or drawing as a means of reduction of metal.

Send a sample of your work and we'll quote the saving by the "Layton" way.

Excelsior Needle Co.
Torrington, Conn., U.S.A.

Coventry Swaging Co., Ltd., White Friars Lane, Coventry, England, Agents for Great Britain. Fenwick Freres & Co., 8 Rue de Rocroy, Paris, France, Agents for France, Italy, Belgium, Spain, Portugal, and Switzerland.



For fewer wasters and uniform work

Bliss Toggle Drawing Presses

No 15-A—Weight 130,000 lbs.

Blank holding pressure is taken up by the frame; relieving bearings. Our patent toggle motion exerts a uniform pressure. Its action facilitates the work and requires less power. The work produced in every case is smooth and uniform.

The blank-holder starts on its upward movement nearly simultaneously with the punch, giving the operator the best possible chance for quick removal of drawn piece. Bliss Toggle Drawing Presses are built in many sizes and cover every requirement. Catalog 5 G. on request.

Small Steel Castings Crucible and Converter

Big Drilling Capacity at Low Cost
The 14-inch "Mechanics" has proven to be one of the most practical tools on the market and our customers appreciate this by giving us their orders repeatedly. It is an adaptable, efficient, economical machine, correct in design and construction, low in first cost and upkeep expense. Furnished with "Tapping Attachment" if desired.
"Mechanics" Drilling Machines
Are built in the following models--No. 1 Friction Drills. No. 2 Friction Drills. 14 in. Standard Drills—with or without power feed. 20 in. Drills—all variations. 23 in. Drills—all variations. 24, 26, 28, 32 and 36 in. Sliding Head Drills. Gang Drills—14 and 20 in. Box Column Type. 23, 24, 26, 28, 32 and 36 in. in Single Column Type.

The advertiser would like to know where you saw his advertisement—tell him.

$35 per Minute-$2,100 per Hour

is a lot of money to pay for one hour of your spare time, but it is being paid—every month.

¶ And the most remarkable part of it is, the Money Is Being Paid To Tell You Something You Ought To Know!

¶ America's best Manufacturers of the lines of goods you purchase, pay $2,100 every month in order to bring before you, in "Canadian Machinery's" Advertising pages, information about their latest and most improved machinery and equipment.

¶ That information should be read by YOU every month. It is invaluable to every buyer, to every owner, business manager, superintendent, and to every machine shop man who is anxious to secure that which will give the greatest service.

¶ Be willing to listen to the story that the advertiser has to tell. The purpose of everything new these days is twofold—to save money and to give greater efficiency. Perhaps in this very issue of "Canadian Machinery" there is a veritable gold mine for you.

¶ Be open to conviction. Read the ads. Weigh them in your own mind. Say to yourself, "Will this machine save me money? Will that new device render my men more efficient? Can that special machinery maker construct my new machines? Would this file which the manufacturers think enough of to spend money to advertise, be cheaper in the long run than the files I have been buying?"

¶ If the men who are spending $2,100 this month to advertise in "Canadian Machinery" were to meet you personally you would listen to what they had to say. If they were to show you a new machine and tell you something interesting about it you would be disposed to examine it, and to examine your own needs to see whether you could profitably use it, wouldn't you? The advertiser is doing it by proxy.

¶ Advertising is the big man's substitute for a personal talk. It is timed for your convenience, for you can read in your leisure. The facts are hard and cold in the printed word. Advertising is paid for by intelligent men for intelligent men to read.

¶ Read the Ads.! Be they large or small they are full of meat. They are written and paid for by firms who are reliable, who are up-to-date, who are liberal, with liberality sticking out of their goods and their service. They are the firms it will pay you to do business with.

¶ Read the Ads.

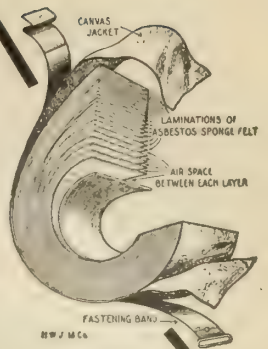
A Sure Way to Reduce Your Coal Bills



If the pipes of your steam plant are covered with only an ordinary covering, or not covered at all, you are wasting hundreds, perhaps thousands, of dollars every year. Repeated tests have proven that when pipes are not properly insulated, from one-quarter to three-quarters of the fuel burned is wasted by radiation and condensation.

J-M Asbesto-Sponge Felted Pipe Covering

positively prevents radiation and condensation. It carries steam a mile with practically no loss. It is the most efficient covering on the market, because it confines the greatest amount of dead air—the secret of insulation.

J-M Asbesto-Sponge Felted is also the most indestructible covering on the market. It will not crack, break or lose its insulating value from vibration or rough usage. Write nearest branch to-day for Catalogue No. 100.

0.00080: A RECORD BREAKER

The above figures have nothing to do with baseball or horse-racing or any other line of sport, but represent a record made by MAGNOLIA METAL in a test by UNCLE SAM.

These figures are furthermore vouched for and made authentic by being recorded in the Annual Report of the Secretary of the Navy for year 1888—pages 397 to 410 inclusive.

Three expert Naval Engineers spent weeks testing MAGNOLIA and the results were so favorable that they recommended its use by the Steam Engineering Department of the Navy.

The above figures represent the wonderfully low frictional co-efficient obtained in the Water test —they also tested with Sperm Oil. The records show:—

Sperm Oil Test—50 lbs. pressure per square inch....495.73 R.P.M.
Co-efficient of friction.....0.0011875

Water Test—300 lbs. pressure per square inch ....491.87 R.P.M.
Co-efficient of friction.....0.00080

It is doubtful if such low frictional co-efficients were ever before obtained in any test of babbitt metals.

Very likely, you are like most mortals, well posted on many kinds of records useful and useless and we would like you to add these figures to your fund of information because they represent records worth remembering. Please also bear in mind that a babbitt having such a low frictional co-efficient, wears longer, absorbs less power, requires less lubrication, cheaper oils can be used, less metal is needed, cost of frequent rebabbitting is saved, the coal pile lasts longer and it gives the Engineer rest and peace of mind. Why not cast off the shackles of high priced or inferior metals and add to the efficiency of your plant by using MAGNOLIA METAL?

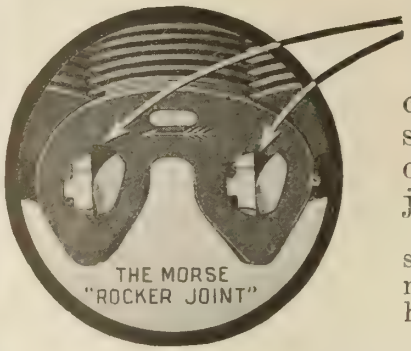
Sure, there are chains and chains, But, only one "Rocker-Joint."



When a salesman calls, tie him down to a detailed description of the chain joint.

All makers can furnish the same materials, can use the same grade in manufacture, possibly can meet the required deliveries, but no other maker can furnish a chain with a "rocker-joint."

When you learn how the joint is constructed, you, yourself, can tell about how much friction there will be, how much lubricant and attention will be required, and about how often joint pins and bushings will have to be renewed.

The joint is the vital part of any silent chain. Any chain maker can change materials, shop conditions, and shipping facilities to suit his own or your pleasure, but no chain maker can give you a two-pin (no bushing) "rocker-joint" except the Morse Chain Company. No other chain joint is even near like it.

The two-pin construction practically eliminates friction and reduces repair and maintenance costs to a minimum.

Let us figure on a trial drive for you. Write us for a copy of Bulletin 11 *to-day.*

GEARS

Cut this out,—more coming each month.

GEAR DATA
FOR
YOUR NOTE BOOK

Definitions and Rules for Gears
from The HAMILTON GEAR & MACHINE CO., Toronto.

Diametral Pitch (D.P.) of a gear is the number of teeth per inch of pitch diameter.

Circular pitch (C.P.) of a gear is the distance from centre to centre of teeth measured along the pitch circle.

Circular pitch equals 3.1416 divided by Diametral pitch.

Thickness of tooth at pitch line is half the circular pitch, or equals 1.5708 divided by the D.P.

Addendum is the distance from pitch circle to outside of gear.

Dedendum is the distance from pitch circle to bottom of tooth.

Clearance is dedendum minus addendum, or equals 0.157 divided by the D.P., equals 1-10 thickness of tooth.

If outside diameter (O.D.) of a spur gear is given to find diametral pitch, add two (2) to number of teeth and divide by the O.D. in inches. Reverse process to find O.D.

Pitch Diameter equals the number of teeth (T) divided by the Diametral pitch, or it equals the number of teeth multiplied by the circular pitch and then divided by 3.1416.

Distance between centres of two gears is half the sum of their pitch diameters.

No. 3A Universal Milling Machine

The Constant Speed Drive Enables You to Pull Heavy Cuts

The constant speed drive type of milling machine was originated at the shops of the Brown & Sharpe Mfg. Co., and placed upon the market by them. The fundamental principle of this type of machine is a single pulley or motor running at a constant speed, from which develop features that are distinctly advantageous in modern milling machine practice.

Brown and Sharpe

on a Milling Machine is just as much of a guarantee to you as the name "Sterling" on silver. You can depend upon a B. & S. Machine to accomplish what is claimed for it. A glance at the above illustration will show the lines and proportions of the machine as a whole, the heavy and massive frame, the large and rigid base, the vertical depth of table, saddle and knee, the rigid arm brace and arbor support, and the accessibility of all hand wheels and levers for controlling the various movements.

Any standard constant speed motor can be employed on this machine. The drive is direct from the countershaft to the machine driving pulley, which is of large diameter and runs at a constant speed.

Capacity of this machine is, longitudinal feed, 30 in.; transverse feed, 10 in.; vertical feed, 19 in.; all feeds automatic.

Write to our nearest branch for special circular containing full description and specifications of the B. & S. No. 3 Universal Milling Machine.

Longue Pointe Plant of the Canadian Steel Foundries, Ltd.

By L. G. Dennison, B.A., B.Sc.*

For several years the demand for steel castings throughout the Dominion of Canada has been greatly in excess of the productive capacities of the various established steel foundry plants, in spite of their most strenuous efforts to cope with the situation. With a view to fully satisfying this present particular requirement and at the same time provide for, at least near future needs ,as further development takes place, the Canadian Steel Foundries, Ltd., decided to erect a thoroughly modern and commodious additional plant at Montreal. A few months ago, production was commenced, and as soon as everything is in full swing, 3,000 tons per month will be turned out.

THE attention of the people of Canada has been called very frequently to the wonderful development of the iron and steel industry in general, but little has been heard of the progress in the making of steel castings in Canada. While this branch of the steel industry is not as large as some of the other steel making units, such as rail mills, it is none the less important. It is interesting to note that the new Longue Pointe plant of the Canadian Steel Foundries Limited, is, in design, layout, construction and equipment, the last word in up-to-date steel foundry construction, and one which takes front rank amongst the foundries of America.

The Canadian Steel Foundries, Ltd., was organized in 1910 for the purpose of taking over the Montreal Steel Works, Ltd., having an existing plant at Point St. Charles, Montreal, and a plant under construction at Longue Pointe, Montreal —also the Ontario Iron and Steel Co., Ltd., with steel and rolling mills at Welland, Ont. The plant at Longue Pointe started operation on July 4th, of this year, and with its capacity of 3,000 tons per month, brings the combined monthly capacity of the three plants to approximately 5,000 tons, thus doubling the entire steel casting capacity of Canada.

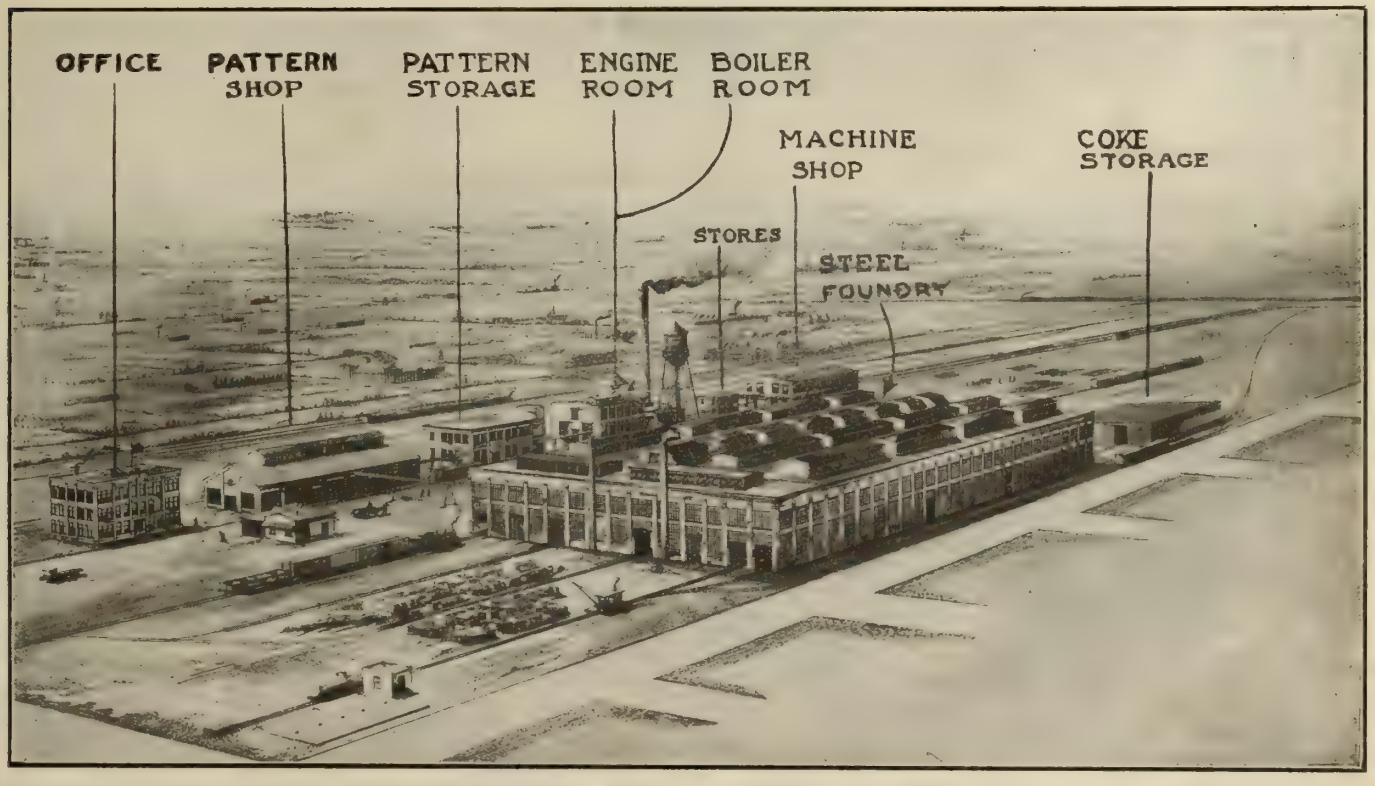
The demand for steel castings is ever increasing, the largest users being the railways, locomotive and car builders, bridge, dredge and ship-building companies, and machine tool makers. The Longue Pointe plant has been equipped with special annealing ovens, gear molding machines, roll turning lathes and straightening presses, to take care of the requirements of these different concerns. The firm manufactures at Longue Pointe locomotive frames, wheel centres, miscellaneous engine castings, double body and truck bolsters, high carbon rolls, gears, dredge buckets and a general run of steel castings. In addition to the regular open hearth products, castings of manganese and vanadium steel are an important branch of the firm's business. A specialty is made of high grade manganese steel switches, frogs, mates, diamonds and all intersection parts for steam and electric railroads, as well as manganese castings for dredge work, mining and crushing machinery. The vanadium steel produced is used largely in engine frames and smaller miscellaneous castings where great strength is required.

The Buildings.

The plant is situated in Longue Pointe, about a mile east of Montreal City limit. The property extends to the river and the buildings are about a quarter of a mile therefrom.

The latter all have structural steel frames, concrete foundations, brick curtain walls and steel window sashes. The main buildings have concrete roofs, with the exception of the power house and machine shop, which have terra cotta roofs. T. Pringle & Son, Ltd., of Montreal, were the architects and engineers.

*Associate Editor, Montreal.



BIRD'S EYE VIEW OF THE PLANT.

They prepared the plans and specifications and supervised the construction. The machine shop and power house were built with both gas and air chambers, the former being bricked up. Should the supply of oil be cut off, or the price become prohibitive, a producer can be installed. At the south end of this aisle is a specially designed continuous coal-

INTERIOR VIEW OF PATTERN SHOP.

EXTERIOR VIEW OF PATTERN SHOP.

erected by the Bishop Construction Company and the balance of the plant by C. E. Deakin. The Dominion Bridge Company supplied and erected the structural steel work, and H. C. Hitch & Co. built the concrete foundations and did the grading for the main foundry building.

The Foundry.

The foundry measures 436 feet long from north to south, and is 264 feet wide. It is divided into five aisles, one extending across the south end and four running longitudinally from this aisle to the north end of the building. Stock is loaded into charging boxes in the yard and brought into the foundry to the west aisle which is served by a 15-ton Dominion Bridge travelling crane. Stock is charged into furnaces by a Morgan 5-ton, 4 motor, high type charging machine, seen in the view of the charging platform. There are two 25-ton acid furnaces using oil fuel, and provision has been made for increasing this number if necessary. The furnaces are of very heavy and substantial construction and are arranged to use either gas or oil. The regenerative furnaces are

G. D. SMITH,
General Superintendent.

fired annealing furnace into which the castings are run on trucks. Next to this is a tank built of concrete for the purpose of quenching manganese castings.

Lettering the longitudinal aisles consecutively from the west side, aisle A is occupied by the open hearth furnaces, etc.; aisle B is the casting floor; aisle C contains the drying ovens, and aisle D is the molding floor.

The last mentioned floor is served by a Dominion Bridge 20-ton crane and a Morgan 30-ton crane. Moulding sand enters at the north end in specially built cars and is handled by a single line grab bucket operated by the cranes. On the east side of the bay are six wall jibs with air hoists for handling flasks and moulds. The flasks are almost all sectional, of heavy cast steel and are, of course, of all shapes and sizes.

When ready for drying the moulds are placed on trucks on the moulding floor and pass into the drying ovens in aisle C. The battery of drying ovens is seen in the illustrations on pages 326 and 327. They are all equipped with Kinnear rolling doors. In the south end of this aisle is the core-making department, the core ovens being in line with, and on the south end of, the mould-drying ovens. When sufficiently dried the moulds are pulled from the ovens to the casting floor, aisle B. The crane equipment in this aisle comprises one 20-ton Dominion Bridge, and one 30-ton and one 40-ton Morgan. For taking the steel from the

VIEW OF DRYING OVENS FROM CHARGING PLATFORM.

POWER HOUSE.

furnace there are two 35-ton and three 24-ton ladles of usual type. They were built by the John McDougall Caledonian Iron Works, Co., Montreal. At the north end of this aisle is the manganese oil-fired furnace, and at the extreme south end a large annealing furnace.

The Fettling Shop.

After castings are poured and shaken out they go to the fettling shop, which extends right across the south end of the building. For handling castings in this shop there is a 30-ton Morgan, and a 15-ton Dominion Bridge crane, together with a Whiting electric traveling wall jib. There is the usual equipment of compressed air chipping hammers and small machines. The cold saws consist of one 12-inch, two 20-inch and one 50-inch Newton, the two latter being driven by a 10 and 15 H.P. D. C. motor, respectively. Most noticeable of the larger machines are the Bertram 48-inch lathe direct driven by a 35 H.P. Canadian General Electric motor, and a special Morton travelling double head shaper with 40 ft. bed, specially designed for steel foundry work on frames, etc.

The two straightening presses are located in aisle A. One is a 170-ton press with a 10 H.P. D.C. motor, the other is 400-ton with a 25 H.P. motor. Both machines were built by John Bertram & Sons, to the Canadian Steel Foundries' special design.

Transformer House.

Power is obtained from outside sources at 10,000 volts. This pressure is stepped down to 550 volts in the transformer house, a brick and concrete building measuring 35 ft. by 10 ft. It is divided into five compartments, three of which are occupied by 3-phase, 10,000-550 volt step down transformers, while the other two serve for the high and low tension switches respectively. The transformers are self cooled, with water pipes attached in case of overload. Tile ducts carry the rubber covered cables to the power house.

The Power House.

A view of the interior of this is shown on page 326. A Niles-Bement-Pond five-ton hand-power crane serves the full length of the building. There is a Rand air compressor with a capacity of 1,582 cubic feet of free air per minute at a pressure of 100 lbs. per square inch. A Bellis & Morcom 150 K.W., 550 volt A.C. unit serves as a stand-by in case the power from outside sources is cut off.

The 550 A.C. current as received from the transformer house is converted to 220 D.C. by means of two Canadian General Electric motor-generator sets. The larger is of 250 K.W. capacity and the smaller 50 K.W. The power delivered by the smaller unit is used for the electric welding outfit only and that from the larger unit for the cranes and other D.C. motors.

The Switch Board.

This consists of 23 panels and was built by the Canadian Westinghouse Co. It has been liberally designed with six spare panels, to provide for any increased load in the future. Of the remaining 17 panels one is the incoming panel, power reaching the board at 550 volts. There are two A.C. panels for the motor-generator sets, the power returning to D.C. panels. The two motor-generators are not paralleled on the D.C. side, as they are used for different purposes. The switching arrangements however are such that they can be paralleled in case additional power is required on either circuit. The D. C. is distributed from three panels; two for motors and one for light.

From the transformer house, 550 volt power goes directly to two 275 K.W. transformers. and thence to the board at 220 volts. From there it is distributed from eight panels, one for lighting and the other seven for the large motors.

Boiler House.

The location of this is shown on the general view on page 325. Standard gauge tracks run through a coal storage annex on the east side of the boiler house, the entrance to the coal store being equipped with Kinnear steel roller doors. The hopper coal cars run in on a trestle-supported track and drop the coal

CASTING FLOOR READY FOR POURING.

CASTING FLOOR AFTER A CAST.

MACHINE SHOP.

into pits which are in an extension of the boiler house floor close to the fires. There are two 500 H.P. hand fired Babcock & Wilcox boilers working at 150 lbs. pressure. Forced draught is obtained by the use of a Parson's blower. The power house is of the same construction as the other buildings with the exception of the roof. This is made of terra cotta blocks and reinforced concrete beams

INTERIOR OF FETTLING SHOP.
On the right is seen the double traveling head shaper by Morton Mfg. Co., Muskegon Heights, Mich.

16 inches apart, covered with 4-ply Barrett specification roofing.

Machine Shop.

The machine shop has a total size of 203 feet by 86 feet, the entire area being served by two five-ton three-motor Niles-Bement-Pond cranes. The crane way is carried from the roof trusses, no central columns being used. This was done to secure free space for laying out steel railway intersections, which are finished in this shop. The equipment differs from that of the ordinary machine shop, in that it consists largely of swing frame grinding machines. These are used for finishing manganese switches, diamonds, etc., which cannot be machined by steel tools on account of their hardness. The floor is of wooden blocks as in the pattern shop.

In addition to the swing frame grinders mentioned above, the more important equipment in the machine shop includes: a 48 in. x 48 in. x 12 ft. motor driven open side planer by the John Bertram & Sons Co.; one motor driven 6 ft. radial drill by the Canada Machinery Corporation; one belt driven 6 ft. radial drill of the same make; one 3 ft. belt driven radial drill, also by the Canada Machinery Corporation; one 14 in. Leblond engine lathe; one 14 in. quick change back geared lathe (Leblond); one 20 in. by 12 ft. engine lathe by the Hamilton Tool Works, Hamilton, Ohio; one No. 3 bolt cutter by Brown & Co., East Hampton, Conn.; two 20 in. vertical drills by A. A. Jones, Pollard & Shipman, Leicester, Eng.; one 6 in. high speed draw-cut saw by the Racine Tool & Machine Co., Racine, Wis.; and a motor-driven No. 4 floor grinder by the Bridgeport Safety Emery Wheel Co., Bridgeport, Conn. Further equipment will be added as required.

The Pattern Shop.

The pattern shop is 112 feet long by 53 feet and employs at present about twenty-five men. The most interesting feature of this building is the floor, made of wooden blocks placed grain up on edge. Each block is 6 in. deep, 3 in. wide and 7 in. long. They are set on 4 in. of solid concrete base which is covered with ½ in. of loose sand, on which the blocks are laid. They are grouted between to about half way up the depth only, the balance of the space being left empty and allowed to fill with sawdust. It was desired to avoid tar on the floor of the shop, as this would make it difficult to sweep in hot weather. The shop is lighted by three rows of 500-watt lamps. One row of six lamps runs down each side wall and one row down the centre.

The pattern storage building is located about 60 feet from the pattern shop and measures 102 ft. by 52 ft. It is a two-storey building of fire-proof construction, fitted with a fire sprinkler system. Heavy patterns are raised to the upper floor by an elevator.

Forge Shop and Oil Storage.

There is a small temporary forge shop giving employment to about ten men. A permanent steel and concrete building will be erected in the near future.

The oil storage house contains five steel storage tanks of an aggregate capacity of 90,000 gallons. These are filled by gravity flow from tank cars, the oil being thereafter circulated to the furnaces by a motor driven rotary gear pump.

Testing of Materials.

The inspector's room will contain a motor driven Olsen tension testing machine. There are also physical and chemical laboratories. The chemical laboratory is equipped with a microphotographic apparatus and an electric muffle furnace, the latter being built by the Multiple Unit Electric Co., of New York city. All the heating in this laboratory is done by electricity, and it is one of the few rooms of its kind in which a bunsen burner cannot be found.

Heating and Lighting System.

For lighting, 220-volt, 550-watt Tungsten lamps, equipped with Benjamin shock absorbers, are used in all the buildings. This voltage was used to prevent the possibility of the employees taking the lamps home with them. All the buildings are supplied with steam from a central power house for heating purposes, the overhead system being installed in the foundry. The heating apparatus was installed by the National Boiler Washing Co., of Montreal, as was also the sprinkler system which is placed in all necessary parts of the plant. All pipes and wires from power and boiler house to foundry are in an underground

OPEN HEARTH FURNACE CHARGING FLOOR.

tunnel which is of sufficient size to allow workmen to pass through.

The Water Supply.

A pump house at the water edge houses a 5,000-gallon per hour centrifugal pump with 150 ft. lift. It was built by the John MacDougall Caledonian Iron Works, and is driven by a 35 H.P., A. C. motor supplied by the Allis-Chalmers-Bullock Co. This pump forces water up to a 50,000-gallon storage tank situated on a specially built tower. The tank is located between the power house and the foundry and can be seen in the illustration on page 325. This tank supplies water to every part of the plant.

Shipping Facilities.

An elaborate system of tracks has been laid down in order to give convenience in the shipping and receiving of manufactured products and of raw material. These tracks connect with the C. N. Q. Ry. The property borders on the river and it is the intention eventually to build a wharf with a track leading to it. The company will thus have their own docking facilities for receiving raw material and shipping the finished product either up or down the St. Lawrence.

The yard is served by a locomotive, and also by a heavy locomotive crane, the latter having a capacity of 17 tons. There is an electro-magnet weighing about 3,000 lbs., which can be attached to the end of the boom. Its lifting capacity is 5 tons. This equipment is extremely valuable for loading and unloading steel and iron, as no time is wasted attaching the hook to the load. The crane has its own generator delivering power at 275 volts. The truck is 25 ft. long and weighs 57 tons. It was manufactured by the Industrial Works, Bay City, Mich.

The Canadian Steel Foundries use a gasoline motor-truck for local delivery of heavy pieces from the foundry. More of these vehicles are to be secured and a garage is to be built.

Welfare of Employees.

For the benefit of employees a lunch room has been built. The tables run the whole length of the room and seat about 500 men. The company owns another large house near the works which is used as a dining-room for the office staff. There is a hospital room, 15 ft. by 20 ft., well lighted and equipped with hot and cold water and other necessary apparatus and supplies. A doctor visits the plant three times a week at the expense of the company and gives consultation free to all employees. Those injured in the works are visited at their homes.

The wash basins and lavatories are in a separate brick building, designed specially for the purpose. One end of this building is fitted up for the use of foremen. Throughout the foundry are sanitary bubbling drinking fountains.

An employees' magazine is published for the Canadian Steel Foundries and the Canadian Car & Foundry Co., and some 6,000 monthly copies are given away to the employees. Each issue con-

W. W. BUTLER

NATHANIEL CURRY
President, Canadian Steel Foundries, Ltd.

tains about 35 pages. It is well illustrated and contains for the most part information concerning the various plants and employees. There are also business and humorous articles and a small amount of technical matter.

Personal.

Mr. Geo. D. Smith, the general superintendent of the Canadian Steel Foundries, was organizer and manager of the Canadian Switch Co., which started business with $35,000 capital twenty-four years ago, and finally became the Montreal Steel Works. Previous to his connection with the Canadian Switch Co., Mr. Smith was employed by the John MacDougall Caledonian Iron Works Co., by prominent companies in the United States, and by the C. P. R.

The superintendent of works is Mr. J. T. Merritt, who has been engaged in the steel foundry business in the United States for thirty years. He has superintended the building of seven plants.

Mr. W. E. L. Dyer, A. M. Can. Soc. C.E. is mechanical engineer and was responsible for a great deal of the equipment installed. He entered the employ of the Montreal Steel Works eighteen years ago and rose to his present position.

Directors.

The directors of the Canadian Steel Foundries, Ltd., are:

Nathaniel Curry, President.

W. W. Butler and K. W. Blackwell, Vice-Presidents.

W. F. Angus, Vice-President and Managing Director.

F. A. Skelton, Secretary-Treasurer.

E. G. Jackson, Sales Manager.

W. S. Atwood, Chief Engineer.

G. D. Smith, General Superintendent.

A. H. Chave, General Purchasing Agent.

W. F. ANGUS,
Vice-President and Managing Director Canadian Steel Foundries, Ltd.

STRENGTH OF OXY-ACETYLENE WELDS.

THE exact strength of a weld made by the oxy-acetylene process is always something of a mystery to boiler makers, and the average boiler maker is usually very cautious in subjecting an oxy-acetylene weld to excessive stresses. At the Twentieth Annual Convention of the International Railroad Master Blacksmiths, held in Chicago in August, Mr. C. J. Fackler, of the American Car & Foundry Co., Jeffersonville, Ind., described some of the tests that he had made on the strength of oxy-acetylene welding, and the results of these tests will undoubtedly be of interest to boiler makers. The Davis-Bournville welding system was used, and five welds were made in ⅜-inch and ⅝-inch round mild steel rods 18 inches long. These were bent on the anvil in the shape of a coil spring.

The rods were given rough treatment, as it was the object to break them if it could possibly be done. There were three fractures in the ⅝-inch piece and one in the ⅜-inch piece, which were due to carelessness on the part of the welder and not on account of the system. Two pieces of 2-inch by 2-inch mild steel were welded together, and after being brought up to a high heat the piece was drawn down to one-fourth of its original size. A slight fracture was found in one corner. The piece was then bent back and forth in an attempt to break it, but no fracture occurred. Mr. Fackler, therefore, expressed his conviction that a weld can be made on 2-inch material, but that a good operator should do the work.

The usual run of work which is used in the shop with which he is connected is on light stock, such as 3-16 inch plates, making welds from 6 inches to 8 feet in length. If the work is placed in the hands of an experienced welder it has repeatedly been demonstrated that reliable welds can be obtained.

THE UNITED SHOE MACHINERY COMPANY.

THE texts of the majority and minority reports in the United Shoe Machinery Co. case were made public recently. The majority report finds that the company "is a combine, and by the operation of the clauses of the lease which restrict the use of the leased machines in the way set forth, competition in the manufacture, production, purchase, sale and supply of shoe machinery in Canada has been and is unduly restricted and prevented. In view of the circumstances of the case, however, we consider it necessary that the delay of ten days prescribed in Clause 23 of the Act, be extended to an additional period of six months and we recommend that such delay be granted." The clause referred to provides for a penalty of $1,000 per day, after ten days, if the offence is continued.

The minority report concludes:—"Considering the company's methods as a whole, I cannot find that they are against public policy."

EFFECT OF COMPRESSED AIR ON WORKMEN.

IN England, experiments have been made to test the effects of compressed air upon the human organism, by means of a steel cylinder large enough to contain a man lying upon a mattress and furnished with a glass window and apparatus for gradually increasing, and afterward even more gradually decreasing, the atmospheric pressure.

These experiments show that the evil effects experienced by divers and laborers in caissons are due entirely to a too rapid diminution of the pressure on emerging from the diving-bells or caissons. This is explained by the fact that the quantity of nitrogen absorbed by the body rapidly increases with the pressure. When the pressure is too swiftly removed the absorbed nitrogen forms little bubbles in the tissues, and especially in the capillary vessels, with serious consequences that may be avoided completely by a very slow and gradual return to ordinary atmospheric pressure.

STORAGE OF COAL IN WATER.

IN order to provide against the risk of a shortage of coal through labor or other causes, the Omaha Electric Light and Power Co., Omaha, Neb., have built a submerged storage pit capable of holding 6,000 tons of coal under water. The purpose in placing it under water is to avoid loss in calorific value by exposure to air and to prevent ignition by spontaneous combustion. Last winter the company were called upon not only to maintain their own service but to supply coal for household consumption and for some outside refrigerating plants. With this in mind, the pit has been arranged so that a maximum storage of 10,000 tons is possible.

The floor of the pit is carried on piles which are driven through earth and quicksand to solid rock, and are capped by concrete blocks 30 in. square and 12 in. thick. The piles are driven on 5 ft. centres under the entire floor area, the object being to have all the weight of the coal taken by them and not by the earth. The rock is from 25 ft. to 35 ft. below the surface of the ground, while the distance from the floor of the storage pit to the ground level is 14 ft. The pit is placed near the power-house, and between it and the power-house are two receiving hoppers, over which runs a siding from the railroad. A traveling grab bucket crane is placed over the hoppers and the pit, one end running on a girder on the power-house and the other on the top of a concrete wall about 26 ft. above the ground level.

The cost of the entire installation was about $30,000, of which approximately $8,000 was for the foundation work.

The Prevention of Electrical Accidents

By H. M. Gassman

Electricity is such a commonplace in the manufacturing world to-day, that many of us are disposed to treat it more or less familiarly, and thereby overlook its danger possibilities. The writer of this article points out clearly and concisely many of the contributory causes leading to accidents, and indicates the mode of procedure necessary to offset these.

IT is hardly possible to limit accidents entirely, but they may be greatly reduced by a careful study of the conditions. It is well to know "how to act" after an accident has happened, but it is a greater thing to prevent its happening. It is only natural to ask, "Why should we be interested in preventing accidents?" Briefly, the answers are:—First, every employer realises sooner or later that accidents represent considerable loss in money due to the liability incurred, incapacitating skilled employees and disorganizing his business. Accidents directly affect him commercially, to say nothing of the humane side. It is obvious that if an employee cooperates with him towards reducing accidents, he becomes more desirable and more highly valued. Second, from a humane point of view, an employee owes it to his fellow-employees and the public, as well as to himself and those dependent, to prevent accidental death and physical and mental suffering.

Lack of An Electrical Sense.

To the person of average intelligence, electricity is a rather mysterious thing, and there is a general feeling that everything electrical is dangerous. On the other hand, electrical accidents are often the result of disregarding natural laws applying to electricity, and a failure to appreciate the risk involved. It is a well-known fact that when the origin of a fire cannot be positively ascertained, it is attributed to the electrical wiring, where such is present. Nevertheless, the fact remains that electrical work must be considered as hazardous. It is, therefore, especially important to safeguard everyone concerned against injury. This may be in the mine, overhead, on the highway, in the mill, at the factory or the shop, in the power house, or the home. The importance of this can only be fully appreciated when we recall how little is generally known regarding electricity, that a voltage as low as 50 may prove fatal, and that moving machinery is essential to generate and usually to transform electrical energy. We can see dangerous moving machinery, hear the noise that indicates trouble, feel the heat from hot bodies before we come in contact with them, but we lack an electrical sense to detect the presence of electricity by our physical organism. Within the last decade, more or less systematic work has been done in the way of minimising accidents along industrial lines, and some legislation has been enacted in this direction.

Contributories to Electrical Accidents.

The general conditions giving rise to electrical accidents are the same as for all other industrial accidents. Among these might be mentioned the following:—Inevitable; lack of skill; carelessness; ignorance; absentmindedness; lack of guards; insufficient illumination; overwork; intoxicants; disregard of rules; lack of inspection; confusion of orders; misunderstanding; clothing; lack of supervision and management; absence of signals; lack of visual danger signs; lack of preparation before starting machinery; cleanliness, orderliness.

Inevitable.—This covers accidents that could not be prevented and for which no one in particular can be held responsible. In general, such accidents never happen twice in the same way, and there is usually a combination of circumstances leading up to the accident which could not possibly have been foreseen. Statistics from Germany show that this class covers 42 per cent. of the accidents, the remaining 58 per cent. being due to negligence of employee or employer.

Lack of Skill.—The same report from Germany shows that 20 per cent. of the industrial accidents which occur are due to lack of skill. It is therefore important that no man be put on a job unless he has had sufficient drilling or experience to make him skilled at the work. This is particularly applicable in electrical work, where men have to be drilled and trained in any particular branch of electrical work on account of the lack of suitable skilled labor.

Carelessness.—It is a well-known fact that familiarity breeds carelessness or over-confidence. This is a case of "knowing" and not "acting" accordingly. When carelessness becomes habitual, the employee should be transferred to work where there is less or no risk.

Lack of Guards.—Fully eight per cent. of German industrial accidents are due to the absence of guards. The guard may have been provided originally but not replaced by the employee when once removed. Such guards should be used

to protect one from coming in contact with moving machinery, getting in the path of moving machinery, and falling into openings such as in the floors of buildings, or from walk-ways, platforms, and stairs.

Insufficient Illumination.—It is estimated that 25 per cent. of industrial accidents are due to insufficient illumination. This is particularly true where workmen pass from daylight to places lighted artificially. The artificial light may be sufficient for those accustomed to it, but the eye does not respond immediately to the change in light when passing from a very bright illumination to a place lighted at low intensity. It is therefore important that lamps be placed along walk-ways and thoroughfares rather than distributed uniformly over the whole floor.

Overwork.—Fatigue leads to carelessness, and long hours without rest are responsible for many accidents. The physical is so closely related to the mental that fatigue of one affects the other.

Disregard of Rules.—This closely borders on carelessness, but differs from it by being a wilful violation of rules, and covers such things as deeds of daring or boasting, unnecessary exposure to danger, of taking short cuts for completing a job, instead of doing it the safest way, or trespassing in forbidden dangerous locations. Rules should not be made unless they will be enforced. They should be put up in such shape and so distributed that there can be no excuse for the employee not being familiar with them.

Lack of Inspection.—Machinery and apparatus deteriorates and gets out of adjustment naturally, and many accidents can be prevented by a rigid methodical and regular inspection sufficiently frequent to suit the conditions and the apparatus. Whenever unsafe conditions or defects in the machinery or apparatus are discovered, the apparatus should not be continued in service, without orders from a superior, until repairs or adjustments can be made.

Rules Applicable to Electrical Workers.

The following are a few important rules applying to electrical workers; which rules, if observed, will reduce very much the risk of handling circuits of dangerous voltage, or of operating electrical machinery of any kind in any place.

No inspection, repairs, or changes of cables, wire, or apparatus should be conducted by anyone except those authorised.

No temporary work should be permitted unless it is good and safe enough mechanically and electrically to be permanent.

Only skilled and experienced workmen should be employed on hazardous jobs, and such work must be performed under the direction of a competent man at all times.

When instructions are not complete or not thoroughly understood, consult your superior and follow his directions.

Do not handle circuits promiscuously and do not get the idea that you are expert at it. Over-confidence breeds carelessness and accidents are the result. Competent men are cautious, only unskilled and inexperienced men take chances.

Avoid working on live circuits except where absolutely necessary, then take all necessary precaution to insulate yourself thoroughly from the ground and the neighboring wires of opposite polarity, using such means as are provided or as are proper for the risk involved.

Before mounting, examine carefully all poles, brackets, cross arms, etc., to see that they are safe. Do not work on defective poles unless they are properly guyed.

Inspect carefully all guy wires, anchorages, poles, towers, and brackets before putting up wire and straining.

Inspect all apparatus and tools used; if same are found defective discard them or have them repaired.

When handling wires of low voltage, such as for telephones and for signals, use the same precautions as in handling other wires with which they may become crossed. It is not safe to depend upon the insulation on the electric wires to protect you against shock. Insulation deteriorates with age, and especially when exposed to weather or the action of water in mines.

When working on live circuits use one hand at a time and keep the other behind the back. Shocks from hand to hand are the most dangerous.

Insulation on tools and rubber gloves are good things if they are ample for the voltage to be handled, but they are apt to prove a delusion, as they cannot be depended upon being in good condition and satisfactory for the purpose.

Linemen must always use safety belts when working overhead.

Avoid working on circuits running overhead or on lightning arresters while there is any sign of lightning.

Never depend entirely upon tracing out circuits; rather test them out with lamp, magneto, voltmeter, or other means.

When working on a dead circuit that might be made alive, treat it as alive.

Where circuits are controlled only from the power house, written instructions should be given to the man in charge of the power to open and close such switches as control the circuits on which work is to be done. The operator must place a tag on the switch, calling attention to danger of closing same before the work is finished. Before this switch is closed, see that everything is in the clear and everybody has been notified to keep away from the circuit.

It is the safest plan to short-circuit the circuit that has been made dead before working on it.

Switches and wires of high voltage should be placed out of ordinary reach. Where this cannot be done they must be properly guarded to prevent persons coming in contact with them.

Apparatus carrying over 250 volts must have its frame or case thoroughly grounded.

All wires must be supported securely on suitable insulators, and insulated platforms should be installed around apparatus of high voltage that is apt to be touched by the operator or other employees.

Lamps on circuits of 220 volts and higher should not be trimmed without using a suitable insulating platform to stand on.

When working on wires underground, special precautions must be taken on account of the dampness and the fact that grounded circuits are used in such places. The foregoing is part of the presidential address delivered before the Association of Electrical Engineers, Birmingham, Ala.

INTERNAL COMBUSTION LOCOMOTIVE.

AN internal combustion locomotive is being built for test on the Reading railroad, and will contain a 550-horsepower, six-cylinder gasoline engine, suitable for either high-grade or low-ignition fuel oil. It is claimed that this locomotive will be capable of negotiating grades and carrying loads as great as a small steam locomotive and that the direct drive of the steam locomotive has been adapted to the internal combustion engine. A charter of incorporation has been granted to the promoters, and the headquarters of the new company, which is known as the Internal Combustion Locomotive Co., are at Washington, Pa. T H. McNary, of that city, is president

BREACH OF FACTORY ACT.

THE heaviest penalty so far inflicted on any person found guilty of violating the section of the factory act requiring the covering of dangerous machinery was inflicted recently by Magistrate Shaw on Edward H. Newton, superintendent of the Hastings Shingle Manufacturing Co., 1355 Powell Street, Vancouver, B.C., when he was fined $250. The charge was brought by Factory Inspector C. R. Gordon. The case was hotly contested and lasted some time. In prosecuting, Mr. Gordon stated that he intended to protect, as far as he and his assistants were able, the lives of the many workmen employed in the numerous mills and manufacturing plants in Vancouver.

Design of Snap Gauges

NO part of the organization of a modern machine shop demands greater attention or deserves to be treated with a more liberal hand than that section of the tool room which deals with standards of length, in all their numerous shapes and forms. The work of the Engineering Standards Committee has done much towards a unification of ideas on the subject of the correct limits in any particular kind of fit for ordinary commercial purposes; indeed, their labors can now be said to represent standard engineering practice to which all firms should adhere. In accepting these limits, however, and in obtaining full sets of gauges to correspond with them, many firms are apt to forget that a course of shop usage will cause gauges to lose their original degree of accuracy more quickly than might be supposed. A period of six months is sometimes sufficient for the purpose, without presupposing any extreme carelessness or rough handling on the part of the mechanics, whose business it is to use them, or of the shop clerks, whose duty it is to issue, receive, and store them. This result is due partly to ordinary wear and tear on the surfaces of the gauges, partly to wedge action set up, should the job happen to be slightly tight on one side or other of the gauge, and partly to errors in design and workmanship of the gauge itself.

Causes of Error.

Ordinary wear and tear must occur and can be adjusted only by keeping a standard set of shop gauges which are never used in the shop itself, but exclusively for purposes of reference in the gauge room. This standard set ought to be sent once a year to a National Physical Laboratory for test against the ultimate standards there preserved. Unfortunately it is only large and wealthy firms who can afford to spend unlimited sums on their gauge rooms, and still more unfortunately not all of them recognize the necessity of any yearly test. Such firms forget that the continuous though careful usage which their own sets of standard gauges receive is in itself sufficient to cause slight variations in the original dimensions of the standards; and, further, that almost all metals are subject to secular change in length from no apparent cause—a source of error of unknown magnitude when drop forgings are involved, even though they are subsequently annealed.

All these faults are, no doubt, small, but they are cumulative in their effect. Nor is it possible to say whether any particular gauge falls just within or without any given limit without reference to ultimate standards. The positive and negative allowances on the "go" or the "not go" side of any gauge—more particularly of the smaller dimensioned gauges, up to, say, ¾ in., since these are in more constant use than the larger sizes—are so small as to be difficult to measure except upon expensive measuring machines, which are seldom found in any ordinary engineering workshop.

Again, in gauge making shops, it is not an unknown practice for a gauge to be given a tap with a hammer so as to bring it up to final standard. Gauges often sustain accidental falls, and the writer knows of one case in which a gauge was made to fall "accidentally" until it fitted a job! Apart, however, from such an extreme case, no workman will bring trouble upon himself by admitting, without being asked, that he has dropped a gauge, nor must such a proceeding be expected of him. Neither can such falls be regarded as extraordinary accidents.

The Wedge Action.

The wedge action, to which reference has already been made, is accentuated by the fact that the working faces of most gauges are not quite parallel to one another all over their faces. It would indeed be remarkable if they were. Slight differences of the order of 1-10,000 in. or thereabouts are frequently found, but cannot be measured actually without the assistance of other gauges whose accuracy is known to 1-100,000 in., such, for instance, as the Johanssen gauges. Should this wedge-form chance to be in the direction of the overall length of the gauge—that is, with the point of the wedge facing inwards towards the centre of the gauge—more serious errors are likely to occur than if the wedge faces at right angles to this direction. A workman is naturally anxious to pass his work with the minimum of labor to himself; and if a small extra push will pass the job it is difficult to blame him afterwards when examination shows that the working faces of the gauges were themselves slightly out of parallel.

Construction of Gauges.

This brings up the question of the design of the "framework" or shape of the gauge itself, apart altogether from the attainment of any desired degree of accuracy in the measurement of the distance between the working faces. The ordinary type of gauge found in engineering shops is of the double U type, the two U's being joined back to back, and each gauge is thus double-ended, of the ordinary "go" and "not go" types. The best gauges are made from drop-forgings, with ample stiffness in the arms, which are usually elliptical in section. The thickness of the working faces is, again, made sufficient to prevent any tendency to twist or bend about the arm to which it is fixed. The question of the adoption of some other section than elliptical for the shape of these arms might seem worth consideration, if the difficulties of drop-forging could be overcome; a U or a T, for instance, would seem preferable to the ellipse from the point of view of stiffness, which in any gauge is the primary consideration.

Tendency to Cheap Gauges.

Unfortunately the stress of competition is now making itself felt as seriously in the gauge-making trade as in any other; and in reply to a general demand for gauges which shall adhere to the Engineering Standards report in their dimensions and yet be cheap, every effort has been made to turn out an article on which as little manual work as possible has been spent. It is a favorable expression with lawyers that there is nothing more disastrous than cheap law: it is even more true in engineering that nothing is more likely to bring about an expensive disaster than cheap gauges, because the accuracy of the work of the whole shop depends on them.

The moral to be drawn is obvious. Manufacturers requiring new sets of gauges should be careful to give an exact specification of the shape that they require, in addition to prescribing that the limits must be within those adopted as standard. The surfacing and dimensions of the working faces are points which should also receive attention: and as an additional precaution it might be specified that a weight of, say, 20 lb., when applied at the centre of either arm of any gauge, must not cause the working faces to separate by more than a predetermined limit, which should not exceed 1-10,000 in. The exact weight depends on many variables, such as the quality of steel, type of gauge, and length and shape of arm; but each case must be determined on its own merits by trial of what has previously been found to be satisfactory practice. Such a clause would protect manufacturers very largely from shop errors due to "wedge action" when the gauge is in use.

Effects of Temperature.

The quality of the steel of which these gauges are made has not been touched on, since most makers have their own individual preferences; but the question of temperature is important, supposing the gauge and the job are not at the same temperature. This sounds a truism which it is needless to labor, because in any shop the temperature of all the steel work will be approximately the same all over the floor; yet it must be remembered that a gauge is held for an appreci-

able length of time in the hot hand of the workman, and as a consequence, differences of temperature of as much as 20 deg. F. may quickly arise between the job and the gauge. It is usually only on work of 1 in. diameter or over that any account of temperature differences need be taken, and then only when the highest degree of accuracy is desired. It is quite sufficient to handle the gauge as little as possible or to hold it with a piece of cotton waste so that it does not come into direct contact with the hand.—T. E. S.

C. N. R. MOUNT ROYAL TUNNEL, MONTREAL.

ALTHOUGH no decision has been arrived at as to the exact system of electrification to be employed in running the cars through the proposed Mount Royal tunnel of the Canadian Northern Railway, it is almost certain that the third rail plan will be ruled out owing to climatic conditions. Already a very large quantity of apparatus for constructing the tunnel has been ordered, including six electrical Garvin air compressors, two of them being the largest in Canada. These are to be manufactured by a Chicago company, and will be driven by 400 horse-power, three-phase sixty-cycle 2200-volt synchronous motors. The remaining four air compressors, half the size of the others, will be supplied by a Canadian firm. The compressors, with a capacity of 2200 cubic feet of free air per minute, will be used to drive the drills in the tunnel and for pumping purposes. When the work of construction is over, the two largest compressors will be utilised in the yards for operating switches, testing air brakes, &c.

The Canadian Northern Railway authorities have made a contract with the Montreal Light, Heat and Power Co. for the supply of electric current. Five electric locomotives have been purchased for use in the construction of the tunnel, which will be 3¼ miles long. From the yards to the city will be 8 miles, and the whole length will be electrified. As far as the model city, 3½ miles from the city terminal, multiple unit trains, consisting of motor cars with trailers, will be used for suburban traffic; and from this point to the yards, electric locomotives for heavy traction will be employed to bring out the regular trains. At the yards these electric locomotives will be replaced by steam. The stations will be about a mile apart.

STEELWORKS YIELDS.

IN a paper on "Steelworks Yields," read before Iron and Steel Institute, Mr. Percy Longmuir and Mr. W. H. Robinson gave the results of a very close study of the conditions of production in a steelworks engaged on products of high quality and wide variety. They took a complete working year, and in their paper showed the results obtained week by week from the more typical departments.

It appeared that the weekly yield on the average of the year's working was:—Bessemer steel, 88.81 per cent.; open-hearth basic, 95.35; open-hearth acid, 96.24; and crucible, 98.81. The percentages of "defective" and "scrap" for the four processes were respectively 0.26 and 4.06; 0.24 and 1.65; 0.14 and 2.37; and 0.52 and 14.93. The results for the rail and billet mill showed that the percentage of "good" products was 78.63 for the Bessemer process; 79.63 for the open-hearth basic; and 77.20 for the open-hearth acid. In the bar mill the Bessemer results were 94.28 per cent. good; the open-hearth basic, 95.05 per cent.; the open-hearth acid, 93.55 per cent.; and the crucible, 93.68 per cent.; while for the rod mill the corresponding percentages were 90.25, 89.98, 90.68, and 92.53. With regard to tires, the "good" percentage was 81.71 with the Bessemer and 84.42 with the open-hearth acid, scrap accounting for 14.82 and 11.94 per cent. in the two cases respectively. For axles, the weekly average showed 86.23 per cent. "good" for Bessemer steel and 85.78 per cent. for open-hearth acid, scrap accounting for 10.14 and 10.68 per cent. respectively.

NEW COAL-MINING MACHINE.

A NEW system of coal mining now be-introduced is primarily designed to cut the entire seam of coal into a granular state suitable for coking, and also to facilitate transportation, as granular or powdered coal can be pumped through pipes with aid of water at far less cost than it can be transported by rail. At the present time, 100,000,000 tons of coal are coked each year in the United States, and it is towards this material that inventors have directed their attention.

The machine is of the milling type, and in addition to cutting the coal from floor to roof into a finely powdered state it also pumps a mixture of the finely divided fuel and mine water to a distant washery, or to storage bins located near the coke ovens. This method renders unnecessary the use of explosives, and it also disposes of the coal dust. For these reasons it is claimed to be particularly safe for use in gassy mines. The machine itself is automatic, and advances along the floor by a simple hydraulic feed mechanism. Rotary cutters on the armature shaft of the driving motor are fed into the face of the seam, and they cut the coal in much the same way as wood is cut by a circular saw. In addition to its forward movement the motor is given a swinging side motion through a limited angle so that the proper width may be cut. A fire hose throws a powerful stream of water against the face of the coal while it is being cut, thus eliminating the dust and keeping the tools cool. The water carries off the product to the nearest sump, from which it is pumped to any desired destination.

THE THOR IRON WORKS, LIMITED.

THE plant formerly operated by the Canadian Shipbuilding Company at the foot of Bathurst Street, Toronto, has recently been acquired by a company organized by a group of Toronto men. The leading figures in the new corporation, which is to be known as the Thor Iron Works, Limited, are Mr. John Malone (formerly of the Toronto Iron Works) President; Mr. John E. Russell (the well-known contractor) and Mr. Wm. Snaith (now associated with Mr. Frank Barber, civil engineer) Secretary-Treasurer. The plant is well equipped for the fabrication of steel tank and plate work, steel roof trusses and light structural work. It is the intention of the new owners, should business conditions justify, to enlarge the scope of the works to cover structural steel work generally. The further fact that the plant possesses a well equipped machine shop and one of the largest pairs of shear legs on the water front, should render it of great service to ship owners for marine repairs. Mr. Russell's thorough knowledge of marine work in general, Mr. Malone's long experience in tank and plate work, and Mr. Snaith's technical and practical ability as an engineer, should guarantee the new company's ability to make a success of their undertaking.

The works are in shape now to give immediate attention and quick deliveries on orders in the lines mentioned.

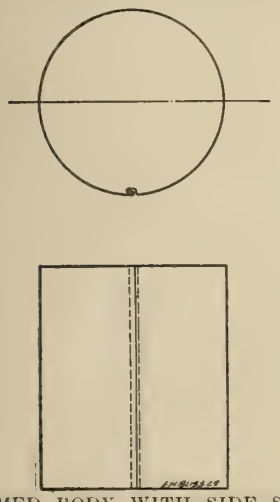
The Canadian General Electric Co., Ltd., has secured control of the Allis-Chalmers-Bullock Co., Ltd., manufacturers of dynamos and other electrical machinery. The arrangements for the absorption of the latter concern by the former were recently completed. The Allis-Chalmers-Bullock Co. has a large plant at Rockfield, midway between Montreal and Lachine. The company was originally an extension of the Allis-Chalmers Co., Ltd., of the United States. The terms upon which the General Electric Co. takes over the Rockfield business are not at present available.

Process of Manufacturing Sanitary Cans Automatically

By C. T. D.

The article deals with the subject in a general way, and is condensed and arranged so as to make it at once readable and interesting. Much attention is at present being given the question of sanitary cans, and the process of manufacture here described enables a more intelligent grasp to be had of the progress and achievement recorded in their production.

THE sanitary or open can, while not by any means new in this country, was not in extended use until recently, on account of the method of manufacture, which was by semi-automatic machinery. Its general use depended on the creation and development of automatic machines which would make possible manufacture along economical lines. During the last few years rapid advancement has been made in perfecting this class of machinery, and to-day it is possible to get a line of automatic sanitary can machinery which has been tried, tested and all "kinka" removed. However, the number of plants operating automatic sanitary can machinery is comparatively small, and in view of the considerable interest in the subject we feel that the accompanying illustrations and descriptive matter will be of interest to our readers.



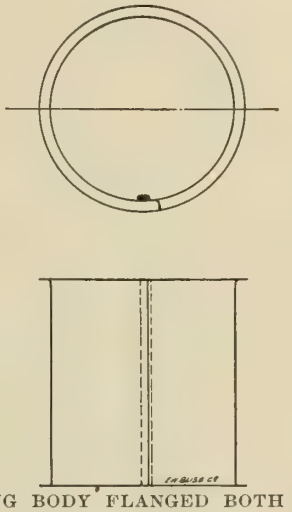
FORMED BODY WITH SIDE SEAM CLOSED.

In Fig. 1 is shown the sanitary can plant of S. Elmore & Co., Astoria, Oregon. It will be noted that the arrangement of the machinery in this plant is somewhat different from that of the plant of the Columbia River Packers' Association, also of Astoria, which is shown in Fig. 2. In both cases, however, the cans necessarily go to the various machines in the same order of operation from start to finish; the difference in arrangement being solely due to the shape of space allotted for machinery equipment.

In the Columbia River Packers' plant, Fig. 2, the body maker is seen in the foreground. The body blanks, previously slit to size in the gang slitters (A), are placed in the receiver (B) and start from this point on their journey through the different machines until they are finally ejected from the tester (C) as a complete can with one end seamed and the can tested. During the entire course of manufacture the cans are handled automatically by the different machines and automatically carried from one to another by conveyors.

Process of Manufacture.

In the body maker (D), the blanks are fed from the receiver (B), one at a time by means of an automatic blank separator and suction feed, which places the blanks flat on a bed and in position to be carried by fingers under the notching dies, where the four notches are cut. They are then carried further on in the machine to the edger where the hooks for the side seams are formed. The blank with the hooks formed is now passed on to the forming horn where it is rounded and held in position while the side seam is bumped or closed. From the forming and closing horn, the formed can body with side seam closed is passed on to the soldering horn, where the continuously operating chain feed which receives the can body on leaving forming horn, conveys it the length of the soldering horn, during which travel the side seam is soldered with liquid solder by means of a rotary solder roll and wiped by rotating brushes. At the end of the solder horn the can is deposited on an endless conveyor which takes it to the flanger.



SHOWING BODY FLANGED BOTH ENDS.

Body Maker Features.

Before passing on to the flanger there are several points in the body maker which should be noted. Taking them in their sequence, as regards the operation of the machine, we come first to the adjustable feature of the notching dies, edger side gauges and feed fingers, the adjustment for all of which parts are made simultaneously by turning two hand wheels (E)—one at each side of the machine. This moves the entire mechanism at once and holds intact the

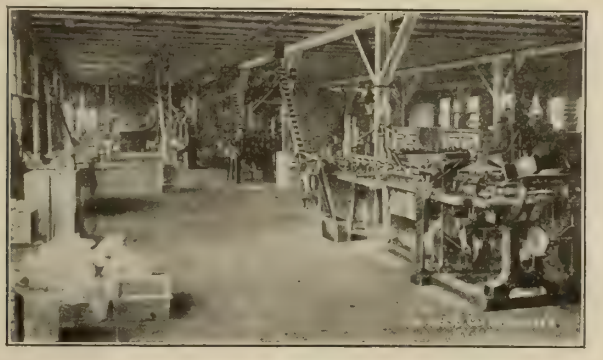


FIG. 1. SANITARY CAN PLANT. S. ELMORE & CO., ASTORIA, OREGON.

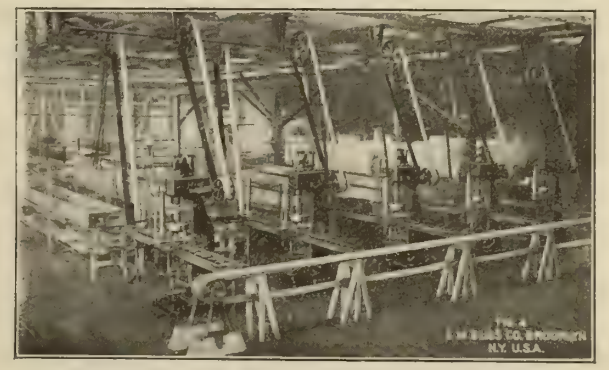

FIG. 4. BATTERY OF DOUBLE SEAMERS.

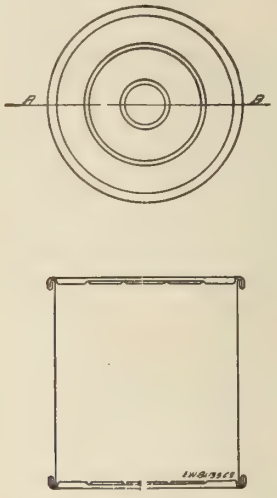
correct alignment. The edger, which is crank operated and which consists of a few strong parts, is the next feature to which attention is directed. Then, we come to the former, the horn or centre part of which is supported straight down to the bed of the machine, a feature the practical value of which will be realized by can manufacturers.



SECTION A-B

COMPLETED CAN WITH BOTH ENDS DOUBLE SEAMED.

The Automatic Flanger.

Going back to where we left the can body on its journey through the different machines, we come to the automatic flanger (F). This machine, into which the can bodies feed automatically from the endless conveyer, automatically flanges, at one operation, both ends of the can body, and then deposits the bodies on another endless conveyer which carries them to the double seaming machines. The flanger is of the four-chuck type, the use of four chucks giving easy movements and insuring flanging without the danger of cracking the tin. The conveyer leading from the flanger feeds the three double seamers. The chute (G) is filled first, the chute (H) second and chute (J) last, after which the flanger (F) has sufficient capacity to keep all three chutes filled.

Double Seamers' Operation.

In order that the operation of the double seamers may be more clearly seen, we will refer to Fig. 3, which shows these machines more in detail. The cans feed automatically into the machine where they are taken hold of by a device for rounding and gripping them, the can standing still during the double seaming operation. The covers placed in the magazines (K), (L) and (M) are fed automatically into the revolving dial, which dial operates in conjunction with the can feed. When the can reaches the holding device, it is raised, the cover in the dial opening is placed in position on the can body and the body, with cover on, is forced against the chuck. Four seaming rolls carried on a rotating head now come into action and seam the cover after which the rolls recede. These seaming rolls are actuated by wedges giving an even and uniform pressure. The can now drops and is carried away by the feed and deposited on the conveyer (N), Fig. 2, which carries the can to the testing machine.

Feeding down the chute (O), the cans enter the tester (C). The revolving carrier of this machine is provided with twenty-eight pockets and has a worm drive. The large number of pockets and the even and uniform motion of the carrier reduce agitation of water in the testing tank. During their entire passage through the water, the cans remain close to the surface, and leakers are readily detected. From the tester, the cans are, by means of a conveyer, carried through a drier and into the shipping room.

Manufacture of Tops and Bottoms.

In order that the operation of a complete plant may be given, it is necessary that we refer to the manufacture of tops and bottoms. The strips from which tops and bottoms are cut are slit in gang slitters (A), and the strips in packs are placed in the receiver of automatic top and bottom presses. They are taken from the receiver one strip at a time by the auxiliary feed and delivered to the carrier feed. This carries them through the dies which cut and form tops and bottoms. Coming from this press, the tops feed through the edge curling machines. As received from this latter machine, they are ready to be inserted in the magazines of the compound applying machines (T) and (W). These machines affix to the tops and bottoms the compound necessary to insure a tight joint in the double seaming. The tops and bottoms are automatically fed from the cover magazine and clamped by revolving discs which carry them through the machine, during which travel the compound is affixed by means of rolls,

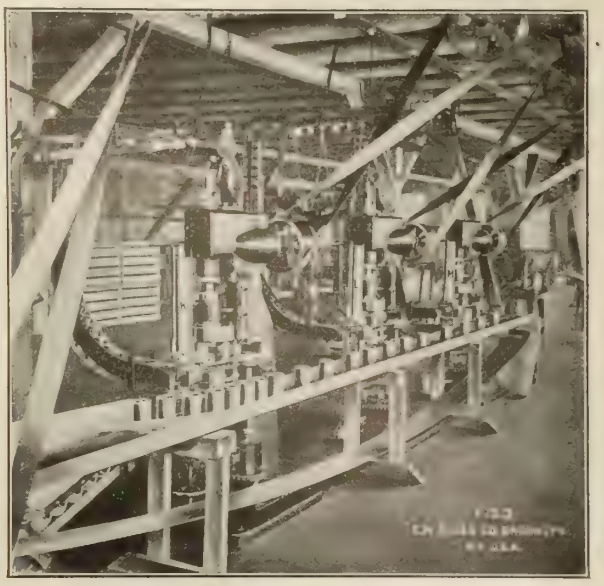

FIG. 3. DOUBLE SEAMERS' MACHINES.

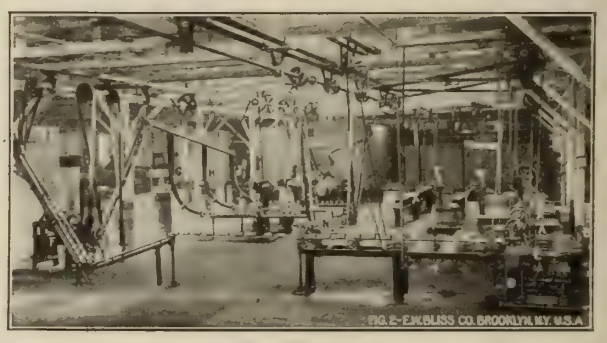

FIG. 2. COLUMBIA RIVER PACKERS' ASSOCIATION PLANT, ASTORIA, OREGON.

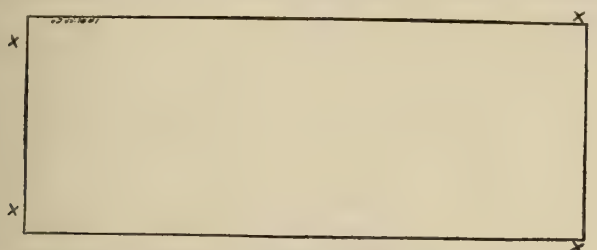
the compound being applied from underneath. The covers and bottoms on leaving these machines drop on the conveyer which carries them through the driers (X) and (Y), after which they are ready to be placed in the magazines of the double seaming machines. In the plants shown in Figs. 1 and 2, no packing is done; the cans in these plants being made with one end seamed and the other end open. The loose ends are shipped with the cans to the cannery where the final packing and sealing operation is done.

Packing and Final Sealing.

Fig. 4 shows a battery of double seamers in the cannery where the packing and final sealing is done, the filled cans feeding automatically from the exhausters into the double seamers. The operation of the double seamers is the same as those in the can plant, already described. The filled can coming from the double seamer is now ready for labelling, boxing and shipment.

The entire equipment of the two plants described was built by the E. W. Bliss Co., of Brooklyn, N.Y., who make a specialty of all classes of machinery for the economical production of round, square or oblong tins.



BLANK AS SLIT IN GANG SLITTERS AND READY FOR INSERTION IN RECEIVER OF BODY MAKER.

SHOWING BODY BLANK WITH HOOKS FOR SIDE SEAM

ROLLING MILL PRACTICE IN UNITED STATES.

IN a paper on "Rolling Mill Practice in the United States," presented before the Iron and Steel Institute in England recently, Dr. J. Puppe, of Breslau, gave details of some of the observations noted by him during a visit to America last year for the purpose of studying the latest methods and improvements in connection with rolling mills.

During the nineties, he said, cogging mills in the United States were almost exclusively constructed on the 3-high system, but since the introduction of the 4-in. billet, the 2-high reversing mill had been adopted almost universally. The 3-high mill was brought to a remarkable state of perfection by John and George Fritz, and there were still a number of such mills at work, especially where one or a very limited number of sections were rolled continuously. In rolling 4-in. billets, however, the great length of the pieces made it impracticable to use the 3-high mill, as the lifting tables could not be made sufficiently long to accommodate them, and the 2-high reversing mill had to take its place.

Comparison With German Practice.

In contradistinction to German practice, where the cogging mill formed the link between the steelworks and the mills for all sections down to 4 in. square and less, also for slabs and flats, in the United States it formed an integral part of a particular rolling-mill train, and performed the roughing down to a certain section only. Typical instances of this practice might be seen at Lackawanna and at Gary. At the Lackawanna works the cogging rolls served for roughing down the ingots for the billet mill, whereas the heavy rail mill had several stands of cogging rolls for that mill alone. At Gary, where the cogging rolls for the rail and billet mills consisted of separate two-high sets followed by a three-high set, the arrangement had been planned not only with the object of getting the largest possible output, but it had also been determined by the method chosen for driving the trains. In very rare instances, the cogging mill supplied the plate mill with slabs, the practice at the works of the Youngstown Sheet and Tube Company affording one such example. In all other mills visited, where slabs were rolled, a type of rolling-mill entirely unknown to the author had been developed—namely, the slabbing mill, which might be described as a universal slab and roughing mill.

Feature of Cogging Rolls.

The cogging rolls were generally of quite small diameter, the pitch circle of the pinions measuring, as a rule, 35 to 40 or 42 inches., the roll diameter being about 3 to 5 in. smaller. Latterly, 34 in. diameter had become the standard for such mills. On this account the roll length was much shorter than in Europe, generally not exceeding 6 ft. 6 in., as compared with 9 ft. 4 in. in German mills. The arrangement of grooves was also different, the first groove not being at the side, but in the centre, and consisting really of the smooth surface of the roll, which was kept at its full diameter at that part. The production of sections varying greatly in size was attained by giving a very high adjustment, in some cases three times as great as in European practice, where 40 in. was about the maximum. The same pressure could be applied to the rolls, while owing to the small diameter, less power was required for driving.

The "wobbler" connecting the upper roll with the pinion must be of a length corresponding to the increased height of rise, and in some cases it was found to measure 22 ft., and in another 17 ft. long. With such mills remarkably high outputs could be obtained—for instance, the cogging mill at Lackawanna turned out 500 tons in a single shift, the 40 in. mill at Duquesne averaged 600 tons per shift, and the 38 in. mill at the same works could turn out 1,300 tons per shift. These quantities, of course, fluctuated considerably, but the facility with which such large outputs were obtained was explained by the fact that the ingots were not rolled to anything like the same length as in Europe, the elongation being generally five to six times, and at most seven times. The rolling period was consequently much shorter. On timing the operations at random, the author noted that nine passes were made in 40 seconds and again in 47 seconds, seven passes in 41 to 48 seconds, and on other occasions the time was remarkably short. In the matter of rapid passes the 3-high mills showed great superiority.

Draught of Cogging Rolls.

Another striking difference between German and American practice was the rate of diminution of the draught of cogging rolls. Whereas, in Germany, a reduction of 14 per cent. was hardly ever exceeded and with harder material an average of 11 to 12 per cent. reduction was the rule, the reduction in the draught from one groove to the next often amounted to 20 per cent. in American practice. The roughing rolls of the rail mill at Lackawanna even gave an average reduction of 24 per cent. per pass in the first six passes. The final section of the piece after passing the cogging rolls was, of course, larger than in German practice, and varied generally from 6 to 8 in. square. The shortness of the rolling period was further accounted for by the manner of controlling the auxiliary engines, which now generally consisted of electric motors. The controllers were operated with very short levers with short ranges, and there were only three notches, stop, forward, and backward.

Rolling Down Operation.

The rolling down operation was mostly performed in the same way as in Germany, the piece being continually turned over, and the section retaining its square form. Here and there, however, an entirely different practice was followed—for instance, in the 35 in. mill of the National Tube Company the ingot was rolled out flat in nine passes through the widest groove to a thickness of 4 in. It was then turned on edge and put through the 4 in. groove, then two passes were again made through the 12 in. groove, one pass through the 5in. groove, and, finally, one through the 7 in. groove. On account of its great width, after the first nine passes, it required to be guided into the next groove and held with hydraulically operated guides. This method had been introduced at one mill in Germany, but it had considerable disadvantages—first, the difficulty of putting the wide piece through the rolls on edge; and, secondly, a tendency to crack at the corners, owing to the material being subjected for so long in one direction to the roll pressure.

It appeared that American cogging mills differed considerably from German ones in point both of construction and design, also in the method of working, and that the high rate of production was chiefly rendered possible by the very much simpler plan of rolling, which consisted in rolling to larger sections, thus shortening the rolling period, and by the rapid and accurate handling of the auxiliary engines. The ingots were almost always heated in soaking pits which could take several ingots at one time.

Billet and Rail Mills.

The author also referred to billet and rail mills. In regard to the latter, he said that the rapid growth of population in the United States was accompanied by an enormous development of railways, and for some years from 1865 onwards, the supply of rails could keep pace with the demand only with difficulty. In 1878 there were 11 works at which rails were rolled, the yearly output being 34,000 tons. In 1880 the number of works was the same, but the production had increased to 800,000 tons. At the present time, 32 years later, there were 14 rail-rolling mills, with a yearly output of about 3,000,000 tons. As the rate of production increased, the cost naturally diminished, the greatest economy being connected with labor. The cost of labor per ton fell from about $3.20 at the end of the 'eighties to $1.65 in recent years, wages remaining at nearly the same figure.

Rail Output and Quality.

When a single rail mill, such as that at the Edgar Thomson works or that at Gary, turned out from 3,500 to 4,000 tons in 24 hours, it was questionable whether that amount of care was bestowed on the work which was desirable in view of the great importance of obtaining the requisite high quality in the finished rails. This supposition would seem to some extent to be confirmed by the fact that rail breakages on American railways were of much more frequent occurrence than in Europe. It must be admitted that the conditions of railway service in the United States were far more severe than in Europe, and that the loads and speeds had been very much increased since the 'eighties; but whether the number of rail breakages was due to inferior quality resulting from rapid production on a large scale, in conjunction with the acid Bessemer process which had long held the field, or was to be attributed to the severe conditions of service was a question which at all events was not yet solved. The fact was noteworthy, however, that the production of rails of special steel was now continually on the increase in the United States, and that there had of late been a considerable decline in the output of acid Bessemer rails.

TEST REPORT ON ELECTRICAL DRILL.

THE accompanying details set forth particulars of a series of tests made on a "Standard" ½ inch, 110 volt, portable electric drill, manufactured by the Standard Electric Tool Co., Cincinnati, Ohio. The tests were made by the University of Cincinnati and were performed and are attested by A. H. Stewart and A. M. Wilson, professor of electrical engineering.

Test Data.

Test No.	Volts.	Watts.	Size of drill	Depth of hole	Time in sec.	Material
1	95	Note	½ in.	2 in.	52	Steel
2	110	450	½ in.	2 in.	67	Steel
3	120	650	½ in.	2 in.	35	Steel

Note.—The watts of the first test varied owing to the varying load on drill as the feed was too rapid to be regular.

The tests were made by placing the electric drill in an upright position under the spindle of an upright drill press, and the press feed used to force the drill against the work.

Nos. 1 and 3 were made under the most unfavorable circumstances met with in electric drill practice.

No. 1 was made at a low voltage and the drill was worked extraordinarily hard. No. 3 was made at an abnormally high voltage, and the drill again worked much harder than it would ever be possible for it to be worked in actual practice.

In either of the above cases, the drill was not damaged in the least, either by the high mechanical strains or by overheating.

Test No. 2 was made under normal conditions both as to voltage and load applied to the machine, approximating as nearly as possible to operating conditions where the tool would be in continuous service.

The time required to drill a ½-inch hole through 2 inches of steel is quite noteworthy in the above test as it shows at even the reduced pressure of 95 volts that a rate of 1 inch in 26 seconds is attainable.

RECORD RAILWAY BUSINESS FOR AUGUST.

THE monthly summary of revenue and expenses of railroads made by the Bureau of Railway Economics from the reports filed by the railways with the Interstate Commerce Commission shows that net earnings for August of this year were larger than of any preceding August and larger than for any preceding month with the exception of October, 1909.

The net operating revenue for the 220,405 miles of line included in this summary, amounted to $96,402,927, which is greater by $10,927,009 than the net operating revenue for August, 1911. This is an average of $437.39 per mile of line for the month, which is greater by $43.83 than the average per mile of line for the month of August 1911. This net operating revenue for each mile of line for each day in August 1912, averaged $14.11, and for August 1911, $12.70. As net operating revenue is the gross income from which must be paid taxes, rentals, interest on bonds, appropriation for betterments, and dividends, it follows that on the average, the operation of each mile of line for each day during August produced only $1.41 more for these purposes than during August of last year.

The railways were bitterly complaining a year ago that their expenditures for taxes, labor, and supplies were not leaving them enough margin with which to make needed betterments and attract the capital necessary for extensions to their track, and additions to their cars and locomotives requisite to the handling of the growing traffic of the country. It would seem, inasmuch as their expenditures are still on the up-grade, that the record breaking traffic of the present simply puts a little more cash in their pockets for immediate needs, and leaves their pressing problems still unsolved.

Current Topics

Gas Producers.—In a paper on "The Operation of Gas Producers with Different Fuels," Mr. R. H. Fernald points out that certain types of fuel, such as lignite, permit a high rate of fuel consumption, especially in producers of the down-draft type. Plants are in operation that consume more than 40 lb. of lignite per square foot of fuel bed area per hour, but the majority of producers do not gasify ordinary fuels at any such rate. It is true that suction and pressure producers may be made to gasify comparatively large quantities of fuel per hour for relatively short periods, but in actual operation with ordinary grades of fuel it is doubtful if the consumption exceeds 15 lb. to 16 lb. per square foot of fuel bed area. The normal figure seems to be much nearer 10 lb., although of course, some variation should be allowed for the "workability of the fuel." Even 10 lb. may be a high figure in the case of fuels having a large percentage of ash of a sulphur content that tends to produce serious clinkering.

Zinc Coating.—In order to protect iron objects from rust it is customery to coat them with zinc either electrolytically or by plunging them in a bath of melted zinc after careful cleansing. The disadvantage of these methods is that a real fusion of the two metals is not obtained. As a result, the zinc coating is likely to be attacked by the atmosphere. This may be avoided, says the Chemical Trades Journal, by a recently patented process which consists in so preparing the iron that the zinc gets into its pores. After steeping in sulphuric acid, the iron is placed in a solution of mercury chloride and heated; this resulting in decomposition of the mercury chloride and precipitation of metallic mercury, which forms an amalgam with the iron on the surface. The iron is then plunged into a zinc bath heated to 500 deg., where it remains three minutes. Iron galvanised by this process shows unusually strong adhesion of coating to metal. Microscopic investigation shows that the zinc penetrates into the pores of the iron, and in case a portion of the coating is worn or broken off, the iron does not rust, owing to the presence of sufficient zinc in the pores.

Motor Notes.—Compound-wound motors are best suited for driving planers, slotters, shapers, rolling mills, punch presses, and other machines with a reciprocating motion of either the tool or the work. This is due to the fact that the greatest demand for power is at the instant of reversal of motion, and the series winding causes an increase of torque as the speed drops, due to the increased load at that instant. The load curve of a compound motor may be greatly smoothed out by adding a fly-wheel, and it will tend to lessen the load on the motor. For machines of the class stated, motors of larger capacity are required than for machines operating with a rotary motion and removing the same amount of metal. Fly-wheels, however, tend to reduce the size of motor required for a given machine.

Commutator Slotter.—Like many other companies, the Third Avenue Railway has designed and built its own form of commutator slotter, says the Electric Railway Journal. It consists essentially of a wooden carrier or bed on which the armature is placed, and of a metal stand or sliding carriage for the drive. An unusual feature is the application of the exhaust system of the shops to carry away the ground mica and copper filings. The armature bed rests on two uprights which have hand wheels at their bases for obtaining vertical adjustment. As these uprights are also movable horizontally they can be readily adapted for any length of armature shaft. Variations in the alignment of the commutator bars are corrected by means of small side screws. The saw arbor is belt driven from the countershafting at a speed of about 3000 revolutions per minute. By means of a bent lever, the operator moves the slotter backwards and forwards along the carriage. This machine now handles eight different types of armatures. All commutators are undercut to a depth of 3-32 inches. About eighteen minutes is required for the commutating pole motors, and about twenty minutes for the various older types of motors.

POROUS METAL.

IT is a well-known fact that the alloys of certain metals in a molten condition solidify very slowly, and pass through a wide range of temperature in the act of assuming the solid state. Thus with a fused mixture in equal proportions of lead and antimony the alloy begins to become solid when the temperature sinks to 450 deg. C., but it does not become solid throughout until the mass is cooled down to half that temperature. At the higher temperature minute crystals of antimony are formed which gradually increase in size, and when at last the metal has cooled down to 225 deg. C., the alloy, which will then consist of about 87 per cent. of lead and 13 per cent. of antimony, crystallizes, forming a network of fine crystals of both metals. Between the formation of the first crystals and the point of complete solidification the alloy remains in a more or less plastic condition. Bessemer made use of this property of semi-solid alloys in order to obtain very sharp impressions of medals and coins under heavy pressure. Mr. Hanover, a Danish savant, has devised a new process, based on this property of alloys, which may prove of value in the industrial arts. He expels by centrifugal force or other means the molten part of the residual metal, filling up the spaces between the crystals, after they are first formed, and he thus obtains an extremely porous crystalline mass of any required metal, useful for making plates for storage batteries, for filling pipe-joints, and other purposes.

MOTOR CARS IN CANADA.

IT is interesting to note how the well-being of Canada is shown in the common use of the motor car, and this despite the hindrances in the way of poor roads and other obstacles to locomotion. The bulk of the cars are imported, the greater number being from the United States, with a few from England. There are, however, seven or eight motor companies in Canada, two of which are native Canadian undertakings turning out a special type of car.

The popularity of the car is greater in western than in eastern Canada; and this is easily explained by the contrast between the topography of these two parts—the open prairie, with its trail and small rainfall, permitting easy travel in almost every direction. Doubtless, if the tests now being made of the motor car in Australia, which is very much on the same principle as the stump-jump plough, and rides over rough bush roads without jolting passengers or goods, are successful, the eastern provinces of Canada will be able to make use of motor locomotion in many districts where it is now practically impossible.

A SOUVENIR THERMOMETER.

The Canadian Steam Boiler Equipment Co., Ltd., 211 Queen St. E., Toronto, are distributing among their friends an attractive little thermometer mounted on an aluminum backing. It registers from 20 below to 120 above zero Fahrenheit and is remarkably sensitive. It can be conveniently hung up in office, shop or engine room and will be mailed free to anyone writing on their firm's letterhead.

The John McDougall Caledonian Iron Works, Ltd., Montreal, with whom the Allis-Chalmers-Bullock Co., of Rockfield, Que., had a merger of sales interests, will, in view of the Canadian General Electric having taken over the A. C. B. Co., in future maintain an independent sales department.

BATTERY-DRIVEN TRAIN.

THE first railroad train operated by storage batteries equipped with multiple unit control recently ran a trial trip from the Pennsylvania Station, New York City, to Long Beach, N.Y., over the Long Island Railroad. The distance, 25 miles, was covered in 57 min., and the return journey was accomplished in 53 min. The train was constructed from the designs of the Federal Storage Battery Co., Silver Lake, N.J., and is equipped with Edison storage batteries. It was built for the United Railways of Cuba and is intended for service on a branch from Havana about 100 miles long, on which a steam locomotive drawing one coach is now employed. It consists of three cars, each equipped with four 200-volt motors and 216-cell Edison batteries. The important feature is that more than one car is operated by a single controller according to the multiple unit control system.

The cars are 35 ft. 5 in. long, and are equipped with double trucks. They have four double seats and four long end seats, and will accommodate 42 passengers. When the train arrived at Long Beach, the batteries were charged for 20 min. from the third rail before the return trip was made. The battery has a capacity of 60 to 100 miles with seven hours' charging, but by giving it short intermediate charges during the day's work, a higher efficiency and a greater mileage can be secured. The power consumed by the train on its demonstration run was about 4 kw. per train mile and, with an estimated cost for power of 1 cent per kw., 150 passengers were carried for 50 miles at a cost of $2 for current.

INCREASED PROTECTION FOR STEEL INDUSTRIES.

THE demand of the iron and steel manufacturing interests for increased tariff protection is being renewed. An influential deputation of iron and steel representatives recently waited on the Government to again urge a tariff change in their favor as a compensation for the complete stopping of the bounties last year. The deputation presented elaborate facts and figures designed to show that the present protection, said to be only about ten per cent., is insufficient to meet on fair terms German, British and American competition. When the present Government came into power the steel interests believed that their request would be favorably considered, and it is understood that when the question was placed before the Government last session a tacit promise of favorable consideration was given. However, the opposition in caucus of the western Conservative members and of some of the rural members from Ontario, led finally to the turning down of the proposal by the Government. This session the steel men expect to gain their request.

Those Present in Conference.

The Ministers who saw the deputation were Hon. W. T. White, Minister of Finance, and Hon. Dr. Reid, Minister of Customs. They were assisted by the Government's tariff experts, Messrs. Breadner, McDougald, and Russell. The deputation included Messrs. J. H. Plummer and Hector McInnes of Halifax, representing the Dominion Iron & Steel Company; T. J. Drummond, President of the Algoma Steel Company; Thomas Cantley and John Irvine, representing the Nova Scotia Steel & Coal Company, and Robert Hobson, representing the Steel Company of Canada, Hamilton. Sir Donald Mann, Vice-President of the C. N. Railway, was also in the city in support of the deputation on behalf of the Mackenzie & Mann smelting interests.

Present Position Anomalous.

The memorial presented to the Government noted that the protection afforded the iron and steel industries consequent upon the abolition of the bounties was now quite inadequate to enable them to hold the business they had hitherto had under the assistance of the bounties. Wire rods, for instance, were entirely unprotected, and the industry was thus in an anomalous position as compared with practically all other industries in Canada. Imports of iron and steel in Canada amounted to over eighteen million dollars, thus indicating an ample field for the growth of the home manufactured product if present tariff discriminations and exemptions were removed. Over twelve million dollars was paid by Canada under present conditions in wages to foreign workmen for iron and steel imported.

Encourage Home Industries.

Under the policy of adequate protection home manufacturers would be encouraged and expanded, with a resulting saving of this twelve millions for Canadian workmen. This argument was expanded with the usual statements in favor of a protective policy for encouraging home industries. It was also urged that the iron and steel men had now little protection against the dumping of large quantities of iron and steel from the United States in Canada at or below the American cost of production.

TRANSPORTING STEEL TOWERS BY MOTOR TRUCK.

OUR illustration shows one of the many uses to which motor trucks may be successfully put. This particular truck is owned by the Dominion Power & Transmission Co., Hamilton, Ont., and is used by them for transporting steel transmission line towers, for which purpose it is equipped with a two-wheeled trailer. Each tower is 41 ft. long and weighs 1,500 lbs., four being hauled at one time. This truck with seven men will deliver forty towers in the same time that one team with four men can deliver four.

The builders of the truck were the Schact Motor Car Co. of Canada, Ltd., Hamilton, Ont. It is one of that company's standard 2-ton trucks, fitted with a 45-50 h.p. engine, left hand drive and centre control. This truck has made as much as 186 miles in 24 hours through heavy mud on country roads. On one occasion the car was started on a Tuesday morning, and the engine ran continuously until the following Saturday night. These facts speak well for the reliability of the car and the good workmanship put into it.

2-TON SCHACT MOTOR TRUCK WITH 2-WHEEL TRAILER TRANSPORTING STEEL TRANSMISSION TOWERS.

C. Durban, of Toronto, was recently appointed City Engineer of London, Ont.

F. A. Fisher, of the Enterprise Foundry Co., Sackville, New Brunswick, left recently for an extended business trip to Pacific coast points.

Vol. VIII. NOVEMBER, 1912 No. 11

THE RAILWAYS AND SUPERHEATED STEAM.

THE use of superheated steam in locomotives is making rapid headway, both on the American continent and in Europe; and it now seems to be generally agreed that greater economies can thereby be effected than by compounding.

In this connection it is interesting to note that Canada leads the world at present, as her railways, headed by the C. P. R., possess a larger number of locomotives equipped with superheaters than any other country, not excepting the United States. Several roads in Great Britain have adopted the fire tube superheater as a partial solution of the problem of ever-increasing train loads. The restricted loading gauge in that country, of course, renders any addition to the boiler power doubly welcome, so that in a few years' time it will doubtless be the exception to find a locomotive on British roads not equipped with a superheater.

Difficulties of packing and lubrication, which were serious when superheating was first introduced, are now being successfully overcome, and though the cost of upkeep on a superheater engine is slightly higher than on one of the ordinary type, this is far outweighed by the additional power gained.

READ THE ADVERTISEMENTS!

NO business manager, superintendent, foreman or machinist can be said to have read any given issue of his trade or technical paper unless he has gone thoroughly through the advertising pages in addition to the editorial matter. Yet some readers merely give a cursory glance, or none at all, over the advertisements, careless of the valuable information they are thereby missing. To stigmatize such a mental attitude as foolish is to state the case mildly. It is comparable to that of a man who would refuse a free course of instruction in some special branch of his profession, even if it could be arranged so as not to interfere with his ordinary business and pleasures. Such a man is never in touch with the latest developments in equipment and supplies; for it is safe saying that if he will not take the trouble to read the advertising pages of a paper he certainly will not wade through complete catalogues, however few or many he may receive.

On the other hand, a reader who familiarizes himself with the advertisements finds them not the least interesting feature of the paper. He becomes thoroughly acquainted with the leading lines on the market and is quick to notice changes of copy. Readers are of course indebted to the advertisers for the fact that they are able to obtain their paper for so small an annual subscription, so that really they are under more or less of a moral obligation to study the "ads."

CATALOGUES OR PRICE LISTS?

WE ARE frequently struck with the varying degrees of merit to be found in the catalogues sent out by builders of machine tools, power transmission appliances, automatic stokers and the whole gamut of engineering supplies. These vary to an extent that cannot be entirely accounted for by differences in the cost of production. In fact, we frequently meet with unpretentious catalogues that far outclass more elaborate rivals in the amount of useful information they contain. Of course, high grade paper, good typographical work and general artistic appearance have their undoubted value in securing a reading for a list that might otherwise be put aside unread; but the point we wish to make is that too many catalogues are nothing more than mere price lists—and practically valueless at that, since, for obvious reasons, the net prices are seldom printed.

Jones, Smith & Company, let us say, make chain hoists, screw jacks or vises. We will suppose they are not a very small concern, nor yet are they at the top of the tree. They do a nice, steadily increasing business, and have gradually worked up a fairly wide connection. Yet, their catalogue may be one of the kind that bears the firm's name on the first page, with a list of their products. Succeeding pages will have a cut of a chain, hoist or screw jack at the head, and below this a mere table of sizes and prices. At the foot of the page we read:—"Our quality cannot be excelled," or some such unconvincing claim.

Such a catalogue may be beyond reproach typographcially; but consider the impression it will make on a prospective buyer compared with that of Robinson, Brown & Co., which perhaps arrives by the same mail. The latter firm are manufacturing the same lines as Jones, Smith & Co., and at about the same prices. Their catalogue, while no more elaborate in get-up and appearance than that of their competitors, gives all possible information that might help to make a sale. It may start out with a short history of the firm, written in an interesting manner. Thereafter, follows a page or two setting forth the particular advantages claimed for the articles listed. These claims are backed up by descriptions of methods and material used in the process of manufacture, and are illustrated by good half tone cuts. Without being too elementary, the catalogue, instead of assuming that the prospective buyer knows all there is to be learned about the subject, points out the chief features that should be looked for in a well designed appliance of the type in question. In short, it is a catalogue worth having, and not a mere price list.

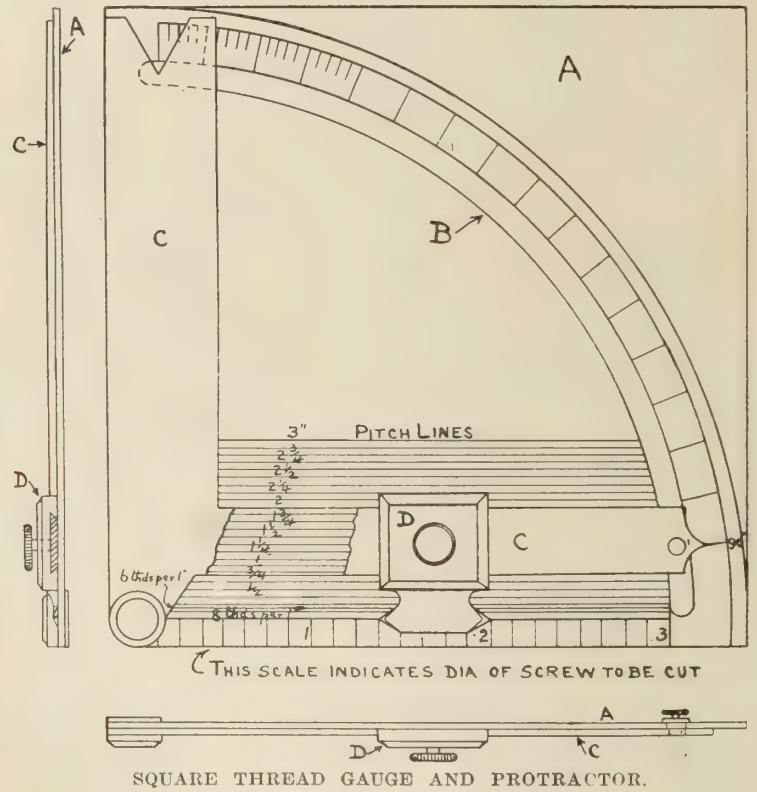
Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

A SQUARE THREAD GAUGE AND PROTRACTOR.

By J. D.

THE tool here shown is a combined bevel protractor and square thread gauge; and its chief merit lies in the fact that it can be instantly and accurately set to the angle or rake required by the lathe tool for cutting any square thread. It consists of a sheet of steel (A), 3 inches square by 1-16 inch thick. Along the lower edge is marked a graduated scale representing the diameters of screw to be cut. Above this there is a series of horizontal lines, representing the pitch—or lead as some prefer to call it.

A steel blade (C), having a horizontal arm at right angles to it is hinged at one corner as shown. The edges of the horizontal arm are bevelled, as seen in the end view, to suit the sliding pointer (D), which can be locked at any point along the arm. The arm is pointed at its outer end to enable it to be set to any angle by means of the graduated quadrant marked in degrees on (A). When set the arm can be locked by means of the radial slot (B) and a small screw.



SQUARE THREAD GAUGE AND PROTRACTOR.

For finding the correct angle of the tool a method in general use and described in many text books is as follows:—Draw two lines at right angles to each other; mark off on the vertical line a length equal to three times the diameter of screw to be cut; then mark off on the horizontal line a length equal to the pitch; draw a line connecting the two points thus obtained, and the resulting angle is the one required. It is then necessary to make a template, or transfer the angle by means of a bevel or protractor before it can be applied to the tool; and for every different diameter or different pitch the whole process must be repeated.

The device here shown gives the same result, but eliminates all the work, as it can be set for any thread instantly. In graduating the gauge, instead of making the graduations on the "diameter" scale equal to three times the diameter of the screw to be cut and those on the "pitch" scale equal to the pitch, it is more convenient to divide both dimensions by three. The "diameter" scale will then be graduated exactly the same as an ordinary rule; and if the horizontal "pitch" lines are spaced 1-24 of an inch apart each line will represent an increase in pitch of ⅛ inch. Of course any other scale could be adopted, provided the proportions were mathematically correct.

The two points on the sliding piece (D) are merely for convenience in setting; it is immaterial which is used, provided one bears in mind which point one started with.

The device is used as follows:—To set the gauge, move the indicator (D) along the horizontal arm until (say) the back point is on the vertical graduation which indicates the diameter of screw to be cut. Then lock (D) in position. Next push up the arm (C) until the same (back) point of (D) cuts the horizontal line which represents the pitch. Then lock the arm in the slot (B). The gauge is now set, and can be applied directly to the tool. The setting will be correct for either right or left hand threads, since the gauge being square, the top can be used as a base.

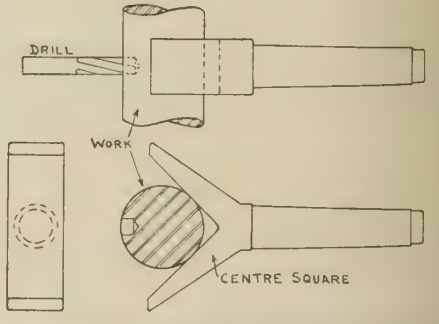
In the case of a very large screw it would be necessary to divide the diameter and pitch by two or three or any other convenient number, and thus reduce the readings within the limit of the gauge.

This device is protected by the designer, J. Davies, 3rd street, New Toronto, Ont. It has proved a great time saver in actual use.

CENTRE SQUARE FOR DRILLING ROUND STOCK IN A LATHE.

By F. Mayoh.

THE accompanying sketch shows a centre or pad, which is a handy addition to a lathe equipment for drilling holes on the periphery of studs or small shafts. The tailstock has its ordinary centre removed and the square here shown is substituted. The piece to be drilled is held in one hand, while the other hand feeds the tail stock spindle forward, thus forcing the work against a drill, which is chucked in the headstock.



CENTRE SQUARE FOR DRILLING ROUND STOCK IN LATHE.

This device can conveniently be made to accommodate pieces from about 5-16 inch to 2¼ inches diameter and of al-

most any length within reason. As the centre of the square coincides with the centre line of the lathe spindles the hole is bound to be drilled fair and true to the centre of the work.

HEAT TROUBLES WHILE TURNING LONG WORK.

By F. H. M.

A VERY striking example of the expansion caused by heat while turning long work of small diameter is shown by the accompanying sketches. Fig. 1 shows a piece of steel, held in the usual manner between centres, with a following rest to support it. Although a plentiful supply of oil is allowed to

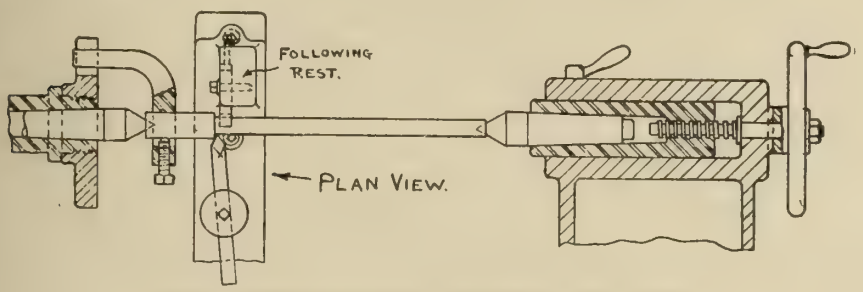


FIG. 1—HEAT TROUBLE TURNING LONG WORK.

flow on these pieces the expansion caused by heat is great enough to cause the work to warp and spring out of shape, unless the centre is released to allow expansion to take place.

The spring centre (Fig. 2) was designed to automatically take care of this expansion, and, as will be seen, consists of a spring, just strong enough to keep

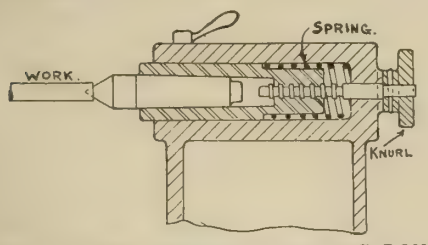

FIG. 2.—HEAT TROUBLE TURNING LONG WORK.

the tailstock centre firmly engaged with the work, while the following rest takes care of the thrust caused by the tool in cutting.

Unless some such provision is made, numerous small grooves are cut by the tool as the work springs away from the following rest, due to the expansion caused by the heat generated.

MECHANICAL TRACK LAYING.

THE modern railway track laying machine is a special piece of mechanism that lays the tracks and then moves steadily forward over the rails. With this machine and a force of 18 men it is possible to lay, bolt, and spike half a mile of track a day, and, by increasing the force, two miles a day.

The cars loaded with the ties and the rails are placed at the rear of the machine so that the tie cars are in advance of those carrying the rails. The rails are drawn forward on rollers and are connected temporarily to each other. As they pass under the cars which carry the ties the latter are distributed on the rails at uniform distances. In this way the chain of rails serves to transport the ties toward the track laying machine, and as the rails enter the machine the ties are picked up by a conveyor and carried overhead, and are distributed on the roadbed at the end of a truss, reaching far in advance of the main body of the machine. In the meantime, the rails are carried forward and are deposited upon the previously-laid ties. The truss may be swung to either side to enable curves to be followed.

The track laying machine is entirely self-propelling and will haul a train of 25 or more cars of material, according to the grade. A train of 12 cars will carry sufficient material for a mile of track.

JIG FOR DRILLING LOCK LEVERS.

By E. W. Tate.

THE accompanying cuts show a lock lever, and a simple jig which has been successfully used for drilling it. Fig 1 shows the lever, which is to be drilled at B, C and D. The hole A is drilled and reamed before the lever is placed in the jig. The latter is shown in Fig. 2. The lever is located in it by placing hole A over the stud E. The fork F then engages with the end of the handle and thus holds the lever central while the hole D is being drilled through the bushing G. The holes B and C are then drilled through the bushings in the bottom of the jig. As may be seen the fork F

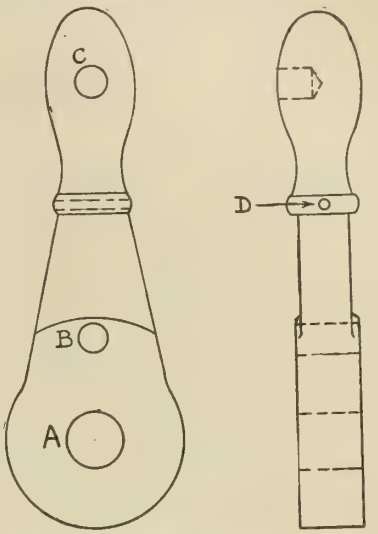

FIG. 1.—JIG FOR DRILLING LOCK LEVERS.

is pressed against the work by a small spiral spring.

This jig is simple and inexpensive, yet accurate; and the idea is applicable to many similar lines of work.

EXTRACTING BROKEN TAPS.

By J. E. N.

IT is often a very difficult job to remove a tap that has broken off short in a hole. All kinds of schemes have been tried, with varying success, for accomplishing it, and at the best it is a slow and disagreeable piece of work.

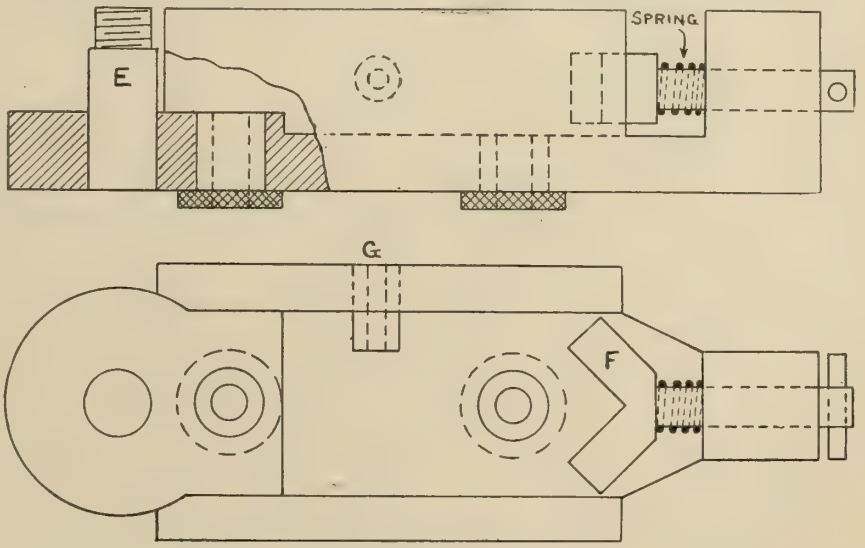

FIG. 2.—JIG FOR DRILLING LOCK LEVERS.

The device herewith illustrated has been tried with good results. A suitable piece of wrought iron pipe has one end cut into slots or tongues as shown. The other end is drilled to take a piece

REMOVING BROKEN TAPS.

of steel rod to form a handle. The slotted end is now inserted in the hole so that the tongues engage with the flutes in the tap, which is thus easily removed.

EQUIPMENT FOR CHARGING RAILWAY BATTERIES.

THE C. P. R. have installed a complete electrical equipment at their Glen Yards, Westmount, P.Q., for the purpose of charging the railway batteries, and it replaces the old storage battery charging plant, previously used. The plant includes a C. G. E. continuous current generator, 25 kw., 200 amperes, 1200-1150 speed at full load, and 125 volts. This is direct connected to a C. G. E. induction type, 60 cycle, 35 h.p., 34 amperes, 550 volt motor. The speed is, no-load 1200 r.p.m., full load 1150 r.p.m. The displaced equipment consisted of a Royal Electric generator, 10 kw., 110 volts, 30 amperes, with a C. G. E. 10 h.p., 310 volt induction motor having a speed of 850 r.p.m., and connected to a 550 volt circuit.

DIESEL ENGINE AUXILIARY STATION, OSHAWA, ONTARIO.

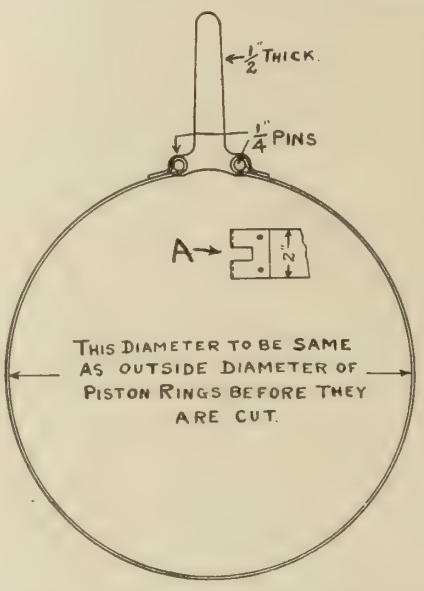
THE Electric Power Company will install at Oshawa, Ont., an oil engine plant, as auxiliary and standby for their high tension transmission system. The first installation will consist of one 650 h.p. Diesel oil engine, direct connected to a 500 kv.a., 3 phase, 60 cycle, 180 r.p.m., 4160 volt generator. The engine and generator are being furnished and will be installed respectively by Messrs. Willans & Robinson, of Rugby, England, and Messrs. Kilmer, Pullen & Burnham, of Toronto. The building being erected is designed for two units, but is arranged so that it may be easily extended to house four additional units similar to the above. The plant is arranged for standby service for the Oshawa Electric Light Co., and also to feed into the Seymour Power & Electric Co.'s 44000 volt transmission system through the step-down sub-station at Oshawa. Messrs. Smith, Kerry & Chace, of Toronto, are supervising the work.

INSERTING PISTON AND RINGS INTO CYLINDER.

By T. R.

WITH the tool here shown it is possible to insert a piston and its rings without loss of temper and danger of pinched fingers. When, as is frequently the case, the tang of a file is used to pinch the rings into place, there is great risk of its slipping out, causing loss of valuable time and perhaps injuring the fitter and helper who have the job on hand.

To make the tool here shown procure a piece of spring steel, 2 inches wide by about 1-16 inch thick, and of a length to suit the diameter of the rings to be inserted. Bend the ends over ¼ inch pins as shown, and put rivets through



INSERTING PISTON AND RINGS INTO CYLINDER.

the lap. Next remove the pins and cut slots ½ inch wide as shown at (A). These slots take the handle which is forged to the shape shown and is ½ inch thick. Two holes are drilled in it for the ¼ inch pins and the latter are slipped through spring and handle.

The clamp is slipped over the piston rings which are compressed into their grooves in the piston by moving the handle to the right or left. The piston is then easily inserted, the cylinder simply pushing the clamp off the rings as the latter enter.

CHARGING OPEN-HEARTH FURNACES.

IN a paper read before the Iron and Steel Institute, on the "Manufacture of Open-Hearth Steel with Reference to Improvement in Yield," Mr. F. W. Paul said that in the early practice of open-hearth steel, it was not unusual to obtain yields of 100 per cent. as an average of 12 months' work, whereas the experience of working with large furnaces during the past ten years indicated that the yield might be taken at 94 to 95 per cent. With the object of inquiring into the causes of greater metallic waste in large furnaces he reviewed in detail the operations of open-hearth steel manufacture, and gave particulars of a new method of conducting the pig-iron, scrap, and ore process, which, in a few practical trials in 80-ton furnaces, had given increased yields of 5 to 7 per cent.

A table dealing with the respective bath areas of melting furnaces employed between 1880 and 1912 showed that the area ratio per ton of charge had gradually decreased from 14.0 sq. ft. to 6.1 sq. ft. The practical limit of width of furnace between linings was reached at about 14 ft., because, if it were made wider, the cost of roof repairs would be greatly augmented; therefore, if it were desired to have an 80-ton furnace, with bath area ratio of 14 sq. ft., it would require to be 80 ft. long. Between the range of 35 ft. and 80 ft. there was ample choice, but this point was referred to merely in reference to bath area and its bearing on waste of metallic charge during period of melting and silicon elimination. It was obvious that a large furnace with reduced bath area ratio, coupled with the necessity of having a good inclined slope in the bottom to drain the metal and slag completely from the extreme ends to the tap-hole, resulted in working with a deeper bath of metal as compared with the shallow bath of small furnaces, and the author suggested that this was one of the indirect causes of less yield.

Proposed Method of Charging.

In the new method of charging proposed by the author, instead of the pig iron being charged in one continuous operation, only a small fraction was taken, about 5 to 10 per cent., and brought to a molten state, and, thereafter, the subsequent additions of pig iron were charged into this initial bath of molten metal, which was maintained in liquid form substantially during the entire period of charging.

After the pig iron was charged and the silicon was sufficiently removed to permit of superheating the metal without loss, or after the metal had been brought to the boil, the steel scrap was charged in such increments and at such rate as was commensurate with the heating capabilities of the furnace maintaining the bath in liquid form. With regard to the use of molten pig iron in basic or acid furnaces, this method of dealing with fractions of the charge pari passu, with additions of iron oxide, permitted the

elimination of silicon at low temperature, and so avoided the fluxing of the banks, thus affording, in the basic process especially, means of working with low sulphur pig iron and greater latitude as regards contents of silicon. The heat of the flame was in direct contact with each successive addition of pig iron and scrap floating on the surface; consequently the gas and air could be maintained at their maximum, and the temperature of the furnace and metal regulated by the rate at which cold material was fed into the furnace. The pig iron and scrap floating in a molten bath of metal with a protective coating of slag were protected from the oxidizing atmosphere of the furnace. Less waste ensued, and the yield was increased.

The Elimination of Silicon.

Another important feature of the method was the practical means of arranging the most suitable conditions for removal of silicon, and obtaining its equivalent reduction of iron from iron ore without diminishing the number of charges per week. As a result of practical trials, it had been proved conclusively that the actual theoretical yield could be more nearly approached than had been accomplished hitherto by the ordinary process. This new method of bringing each successive addition of pig iron, which was melted whilst floating, in contact with the oxide of iron in the slag was a near approach on a practical scale to the ideal of bringing in close contact each molecule of silicon and oxide of iron, so that by the time the pig iron was all charged, the silicon had been more or less eliminated under the most favorable conditions.

LOCOMOTIVE SPEED INDICATORS.

ALTHOUGH recent railway accidents have aroused some interest in the question of equipping locomotives with speed indicators, which are in fairly wide use in many countries, it is doubtful whether the average railwayman fully recognizes the value of such appliances.

Nature of the Mechanism.

There is more than one efficient type of indicator on the market. M. Flamand, the well-known French locomotive engineer, has perfected one that has been in successful use in France for a number of years, while another, already fitted to a few English locomotives, is known as the "Hasler" speed indicator and recorder. All devices of the kind perform two separate but related functions; they give the usual indications of the speed throughout the journey and they compile what may be called the "log" of the journey on a permanent record. The actual indication of the speed is effected by means of a mechanism very similar to that of the ordinary motor-car speedometer, a movable pointer on a dial being actuated by a simple mechanism connected with the driving wheels.

The speed records are made in a less familiar manner. Situated in a box or case, provided with a lock and key so as to prevent the mechanism from being interfered with by the engineer or train staff, is a cylinder bearing a prepared strip of paper, which is ruled for time and speed. The recorder is set in motion by winding up a clockwork mechanism. A small pen, of the kind used on self-recording barometers, is held at a short distance from the paper, and by means of gearing the pen is arranged to move up and down, its oscillations varying with the speed of the locomotive. At predetermined intervals, usually every two seconds, the clockwork mechanism forces the pen down on the paper strip, and in this way a graph is obtained showing the speed of the train at any point throughout the journey.

The phrase "at any point" is of importance. The record, which can be read off by the expert with the same ease as a musical score, not only indicates if a maximum speed not to be exceeded in any circumstances, as is the regulation in some European countries, has actually been exceeded, but shows whether the driver has ignored a speed restriction—temporary or permanent—in force on a given section of the line. That is just the kind of evidence which cannot be provided satisfactorily by means of the "passing times" recorded in the signalmen's books.

It has already been mentioned that these records cannot be tampered with by the enginemen. Where speed indicators and recorders are in use. it is the duty of some responsible official of the locomotive department to remove the records at the end of each day, when they are at once forwarded to headquarters. The examination of the records becomes a matter of ordinary office routine, and the fact that evidence of any excessive speed is automatically recorded against the driver must undoubtedly act as a deterrent.

Speed Restrictions.

It has been asserted, mainly by railway trade unionists, that the due observance of each and every restriction is incompatible with punctuality in the case of the fastest passenger trains. Assertions of the kind have occasionally met with formal official denials, but the use of speed recording instruments would settle the matter beyond doubt. Moreover, although engineers attain wonderful skill in estimating the speed at which they are travelling, judging speed is notoriously difficult and likely to produce conflicting evidence, especially at night or in foggy weather. Therefore it is somewhat anomalous not to provide drivers with a practical instrument that shows the exact speed at all times, thereby eliminating at least one potential danger of the "human factor."

In this connection, it must be remembered that where there is an element of mystery as to the cause of an accident, the provision of speed recorders, the records of which are on the whole not likely to be destroyed beyond recognition, would enable it to be ascertained definitely whether excessive speed was a factor, because there would be evidence as to the exact speed at the moment of disaster.

READER, WHAT DO YOU KNOW?

Among readers of Canadian Machinery there is a clearly defined sincerity of desire to know how each overcomes the daily tasks of the machine, pattern and blacksmith shops, the foundry and boiler shops. It is believed that your methods and devices, while good, may be improved, and thereby made more valuable if you publish them, so that other brains may work on them. We will provide the setting and pay you for the material. When your fellow tradesman puts the superstructure on your foundation, we pay him and pass the "kink" on to you, free. Get into the game.

INDUSTRIAL ACCIDENTS.

A RECENT bulletin issued by the Industrial Commission of Wisconsin gives a report of 5,241 accidents brought to their notice during the year ended June 30, last. Of this number, 873 occurred in foundries and metalworking industries, 186 in iron and steel mills, and 195 in industries in which iron and steel products are used, including shipbuilding, wagon factories, etc. A subclassification shows that emery wheels, presses, falling objects, molten metal, and the handling of heavy pieces were, in the order named, the most common causes of injury.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

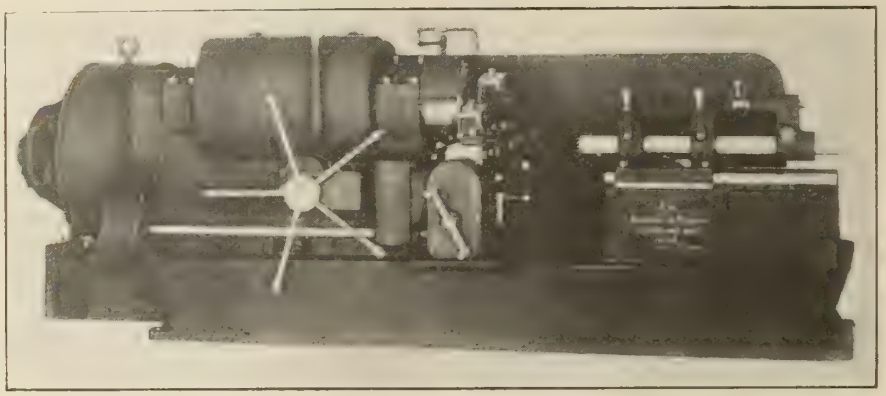
SIX-INCH CUTTING-OFF MACHINE.

AN efficient cutting-off machine should have the following characteristics:

1.—Rapid and efficient operation in cutting.

2.—Facilities for placing and replacing, in the minimum time, stock to be cut off.

3.—Facilities for catching and removing large quantities of chips.



6-INCH CUTTING-OFF MACHINE.

4.—An ample supply of oil and the ability to make efficient use of it.

5.—Rigid and compact construction.

The Bordens and Oliver 6-inch cutting-off tool, shown in the illustration, claims to fulfil all these requirements. It has spindle speeds, varying from 20 to 152 r.p.m. The speed increments of 10 per cent. are obtained by means of a geared head and the use of a Westinghouse 15 h.p., 300 to 1,200 r.p.m. adjustable speed motor, operated with a drum controller having 16 points. The most economical cutting speeds to suit the type of cutting tools used can be obtained at all times. There is ample power available to take care of the full capacity of the tool. The power cross feed produces uniformity of speed, protecting both cutting tools and machine due to the uniform stresses produced thereby.

The automatic chuck, the adjustable stop for the stock, and the drum controller reduces the time of placing and removing the stock to a minimum. Again, the frequent trouble of getting chips caught, which would interfere with the operation of this type of tool, is eliminated by a special design of the tool slides. The support for the slides is fastened to the front of the head, which is widened on each side for this purpose. This support or bracket has openings between the slides and head allowing the chips to fall directly into the pan without possibility of interfering with the operation of the slides. It also permits of the shortening of the main bed, leaving an open space under and to the right of the cutting-off tool slides, making chip removal more convenient.

An oil pump gives an ample supply of oil to cool the cutting tools, and a pan to catch oil reduces the waste to a minimum. The illustration shows the compactness and rigidity of the apparatus, and the motor drive makes it an independent unit which can be placed in any position in a shop to suit the system of routing material.

Mechanical Characteristics.

The following are its principal mechanical characteristics:

Automatic chuck capacity, 6 inches round.

Hole through chuck plunger, $6\frac{3}{8}$ inches.

Hole through spindle, 7 1-16 inches.

Front spindle bearing, $9\frac{1}{4}$ inches diameter by 8 inches long.

Rear spindle bearing, $8\frac{5}{8}$ inches diameter by $6\frac{3}{4}$ inches long.

Cutting-off tools, $\frac{3}{8}$ by $2\frac{1}{2}$ inches.

Motor, 15 h.p. Westinghouse, type S.A. variable speed, 300 to 1,200 r.p.m.

Spindle speeds, 20 to 152 r.p.m.

Floor space, 5 feet 6 inches by 14 feet.

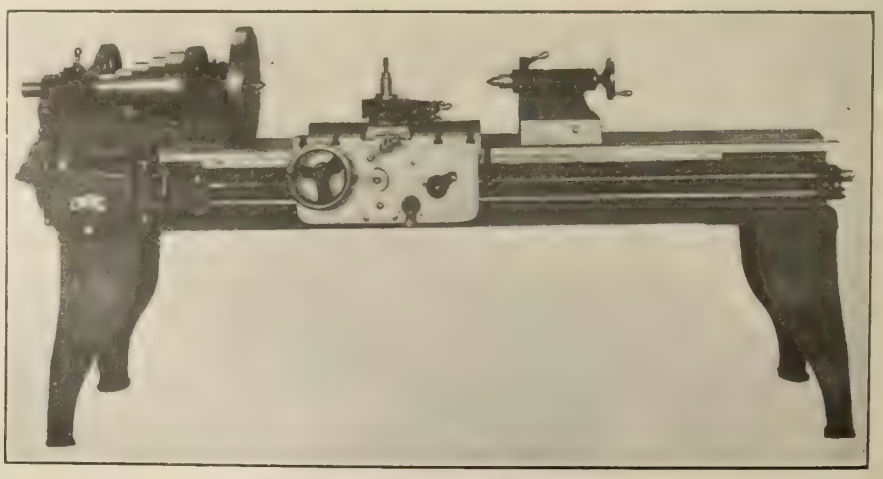
The weight including the motor is about 16,000 pounds.

14—16 INCH QUICK CHANGE GEAR LATHE.

THE accompanying illustration shows the new Conover-Overkamp 14-inch and 16-inch quick change gear lathe brought out by the Conover-Overkamp Machine & Tool Co., Dayton, Ohio. These lathes are built with a 5-step cone and single-back gear head stock, or large 3-step cone and friction double back gear. They can also be furnished with quick change gear box, as illustrated, or with all-geared feed box, or standard belt feed box with standard change gears. Each of these boxes is an independent unit and interchangeable one with the other.

By this interchangeability feature, either of these three units may be attached to the lathe at any time. All holes in these boxes are jigged, and alignments are made by tongue on bed and boxes. All gears in boxes are steel, and bearings are bronze bushings, quickly renewable, in case of wear, without affecting centre distances or alignments. Boxes are fastened to, or removed from bed by four bolts; changes being made in a few minutes time.

The change gear box, gear feed box, and belt feed box are new and most simple in design, having no overhanging parts at the end of the lathe to be in



14-16 INCH QUICK CHANGE GEAR LATHE.

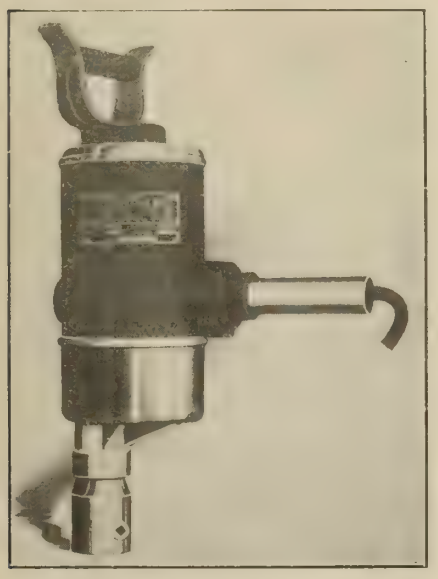
the way of operator or to take up extra floor space. The mechanism of the quick change gear box consists of a driven shaft on which the tumbler gear is mounted. This tumbler gear may be dropped into any one of the eight cone gears. In constant mesh with the cone gears is an intermediate shaft provided with four gears. The set of sliding gears may be engaged with any one of the intermediate gears by means of the lower level in front of the box. This gives 32 changes with but two operating levers, and without the removing or changing of a single gear.

A stud on reverse quadrant is provided for compounding or placing of special gears, enabling the operator to cut special or metric threads with standard lead screw. The gear feed box has four changes of feed, and is operated by one lever. The changes are obtained through sliding gears and positive clutches. Belt feed box is provided with a belt tightener.

Lathes can be furnished with standard legs, cabinet legs, and also with short legs and oil pans. Taper attachments may be added at any time as all carriages are planed and drilled before shipping.

HIGH POWER ELECTRIC TOOLS

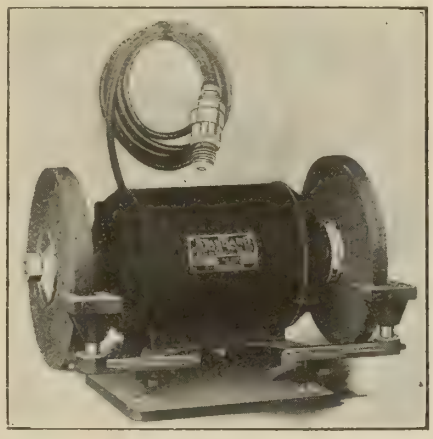
THE Standard Electric Tool Co., Cincinnati, Ohio, has developed and is now placing on the market a line of high power electric tools. The drills are ball-bearing throughout. All gears are generated from chrome nickel steel, case hardened, and are mounted on ball bearings packed in grease. Bearings are absolutely dust proof. The very highest grade German bearings are used. The motors carry a very strong series winding which gives them an excess of power over rated capacity, preventing overloads and burnouts. The best machine tool practice is employed in the mechanical construction, while simplicity and strength have been carefully attended to so as to avoid complicated and weak construction.



HIGH POWER ELECTRIC DRILL.

Drills are built in ⅜ inch and ½ inch sizes for direct and alternating current. The ½ inch d.c. drill is guaranteed to ream up to 7-16 inches in thick metal. In addition, a universal drill of ⅜ inches capacity is made to operate on both direct and alternating current. These drills are built and recommended for the most rigorous and hardest constant service. All armatures and poles in both drills and grinders are built up of the best soft electrical sheet steel and are uniformly insulated.

The grinders are made for tool post, bench and parallel work. A special feature in connection with the tool post or

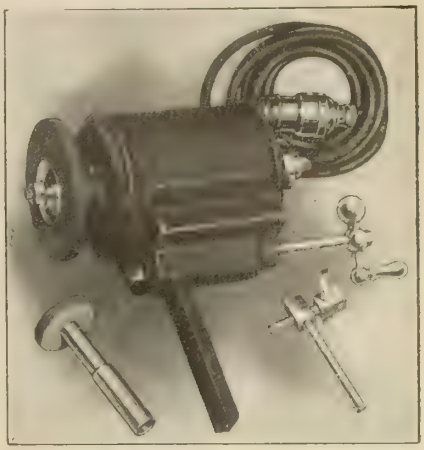


HIGH POWER ELECTRIC GRINDER.

centre grinder is a base which converts it into a bench grinder, by removing slide and placing motor in groove in top of base, as shown in drawing. This doubles range of work increases the value of the tool in all shops because while tool post grinders are indispensable they are used only at intervals, and by this combination they can be kept in constant service. All motors in both drills and grinders are force ventilated by fans of special design, and grinders are furnished with ball bearings, when specified, instead of phosphor bronze bearings adjustable to wear.

A NEW ANTI-FRICTION MATERIAL

THERE has recently been placed on the market a new graphite anti-friction material which has distinctly interesting features. It has been given the trade name of "Graphitol," and is the invention of Mr. F. C. Wrinkler, manager of the British Pacific Supply Co., Victoria, B.C. Graphitol embodies the cement principle applied to the production of a lubricating material of a non-metallic nature to be used in place of metal babbitts and is a radical departure from previous practice both in

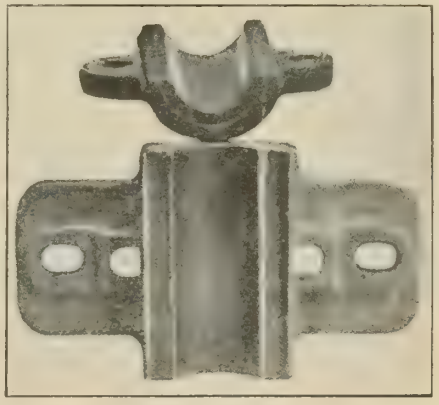


HIGH POWER ELECTRIC GRINDER.

the nature of the material and the method of applying it. It is made in the form of a fine, dry powder, which when required for use, is mixed with a prepared liquid into a stiff paste, and, without the application of heat, is put into place in the bearing box, formed or molded, and allowed to set, which it does in from eight to ten hours.

A bearing is thus obtained which is very largely self-lubricating, ensuring a low co-efficient of friction. Then, too, the heat-resisting qualities of graphite form another important advantage enjoyed by this material.

Other advantages claimed for Graphitol are:—(1) that it is very easy and entirely safe to handle, and can be used to advantage in places where it is difficult to pour molten babbitts; (2) as the material is almost self-lubricating, it requires much less oil or grease to run on than other forms of bearing material, and whatever lubricant is fed to it does not get away without being used, as the



NEW ANTI-FRICTION MATERIAL BEARING.

bearing material absorbs it; (3) the initial cost is less than with babbitts.

Graphitol may also be used as a pipe joint cement; to cure leaks in steam and

water pipes, and as a filler in machinery and parts. Used as a bearing it has absolutely no tendency to crack or disintegrate, and shows surprising endurance. We are informed that some bearings have been running for twelve months with no appreciable wear.

An interesting application of Graphitol was recently made in connection with a dynamo repair. The commutator was not a good fit upon the shaft, so it was centred by blocking and the open spaces were filled in with Graphitol in a plastic state, which was then allowed to set. In this particular instance it would have been very difficult to pour babbit; and moreover the use of Graphitol obviated the danger of babbitt getting into the commutator and causing a short circuit of commutator pairs.

THE "BUESS" OIL-FIRED CRUCIBLE MELTING FURNACE.

A NEW oil-fired crucible melting furnace is being put on the Canadian market by the London Emery Works Co., of London, Eng. This furnace, which goes under the name of "The Buess," consists of a cylindrical steel casting rotating on trunnions. The casting is lined with refractory material having great heat resisting properties, space being left for the crucible which stands on a specially built fire brick support. Compressed air at 15 lbs. pressure and oil are mixed in the patented burner and are blown into the combustion chamber. A pure white flame completely envelops the crucible. The gases escape through an opening at the top and are used to heat the charge metal and the pouring crucible. The tilting is done by worm gear. This operation can be carried on while heat is still being applied to the metal. "The Buess" is used for melting brass, gun-metal, copper, aluminum and iron, and the makers claim the following advantages for the apparatus:—Low oil consumption, absence of clogged burner, due to special construction; saving in labor, even heating of the crucible, preheater serves for heating the charge and also for warming the pouring crucible, no costly foundation needed, and no flues. W. Frank Murphy, 55 St. Francois Xavier street, Montreal, is the Canadian agent.

Hamilton, Ont., one of the leading manufacturing centres of Canada, surpassed itself in the very excellent booklet just received. Both pictorially and artistically it reaches a very high degree of merit, and the facilities enjoyed by this thriving city are brought home to the reader in terse and telling language. An excellent map accompanies the booklet. A copy may be had by applying to H. M. Marsh, Commissioner of Industries, Hamilton.

THE HARE ENGINEERING CO., LTD.

Mr. W. Almon Hare, President and Managing Director of the Hare Engineering Co., Ltd., Toronto, recently returned from a business trip to England, where he was successful in raising the nec ssary capital for building the company's new shops at Galt, Ont., work on which will shortly be commenced.

The Hare Engineering Co., Toronto, has taken over the business of the Standard Engineering Co., Toronto, and will continue to manufacture that company's lines of mechanical stokers, power appliances, steel heating furnaces and rolling mill equipment. In addition they will take up the manufacture of pulp and paper machinery. At Galt a site of six acres at the south end of the town has been secured and the near future will see a thoroughly modern plant in full operation there.

The directors of the company are:—Sir Ernest H. Shackleton, C.V.O., London, Eng.; Arthur Cairn Hodge, Esq., F.R.G.S., London, Eng.; W. D. Sheldon, Esq., Galt; J. F. MacGregor, Esq., Galt; Allan Hills, Esq., Galt, and J. Otty Sharp, Esq., Toronto.

WATER POWERS OF BRITISH COLUMBIA.

The water-power resources of British Columbia are being investigated by the Commission of Conservation and the resulting information is to be published, as soon as it can be made available, in a report to be entitled "The Water-Powers of Western Canada," which is in course of preparation. The commission has three field parties investigating the water-shed of the Fraser River above Lillooet, extending to Tete Jaune Cache and westward beyond the Fraser Lake district.

A USEFUL BOOKLET.

THERE has just been issued by the **Smooth-On Manufacturing Co., Jersey City, N.J.**, the twelfth edition of the Smooth-On Instruction Book, which is well worth having. The great value of Smooth-On to the user lies in its peculiar chemical properties, namely, of metalizing and of expanding when metalizing, and it can be prepared to act quickly or slowly, according to the requirements of particular uses. These properties make Smooth-On a valuable substance in the making of chemical iron cements. To this subject the company's chemist has given careful study for eighteen years, and has succeeded in compounding the valuable iron cements known so generally throughout the world as Smooth-On iron cements. These cements are made each for a special purpose; they are carefully prepared, and when correctly used they make permanent repairs. The different Smooth-On cements are explained in the book, and a careful study of these will prove interesting and profitable. The illustrations are made from photographs of actual subjects, and show some of the many ways in which the Smooth-On cements have been used and the results obtained.

This instruction book will be sent free of charge to any reader of this journal who will send to the Smooth-On Mfg. Co. his name, address and occupation.

WORLD'S PRODUCTION OF OIL FOR 1911.

According to returns recently published, the total production of oil during 1911 was 46,526,334 tons (metric) as against 43,824,304 tons in 1910. Of this former amount the United States provides over 60 per cent., and Russia just under 20 per cent.; the remainder coming mostly from Mexico, the Dutch East Indies, Roumania, and Galicia. One remarkable feature of the last year's production has been the increase in the quantity from Mexico, rising from about 440,000 tons in 1910 to 1,870,000 tons in 1911, the amount being more than quadrupled. The output from the United States increased by about five per cent. during the year, but the figures from Russia show a small decrease. It is perhaps not generally known that there is much less oil produced in Russia at the present time than there was some ten years ago.

The Mesta Machine Co., Pittsburg, Pa., have issued an attractive little booklet illustrating their plant and some of its products. The latter consist principally of machinery for steel works, blast furnaces and power plants, consisting of gas and steam engines, barometric condensers, air compressors, steam-hydraulic forging and bending presses, rolling mill machinery, etc., etc., The only limit to the size and weight of machinery they build is that imposed by the limits which the railroads can handle. Castings weighing over 100 tons have been made in their foundries and finished in their machine shops. The booklet is well illustrated by a large number of half-tones, which give one an excellent idea of the extent of this large plant and of the heavy work there turned out.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

MELTING IRON IN FOUNDRIES.

By J. F. Gaffney.*

ALMOST any kind of an old shell bricked up on the inside and having air blown in through openings near the bottom will melt iron, regardless of the size of the blower, the blast pipe and tuyers; and it is astonishing how many cupolas of this type are in use throughout the country, some of them doing fairly good work.

In the writer's estimation, the cupola is the most important thing in connection with a foundry, and he would not call a man a good, or up-to-date foundryman unless he was thoroughly familiar with cupola practice and the mixing of irons. By this I mean that he should have a thorough understanding of the effects which the different elements found in pig iron have upon each other, and upon the finished product when mixed in varying proportions. I have been responsible for the operation of many different types of cupolas, and the sketches shown here will give the reader a fair idea of one of these.

The results obtained after overhauling and fixing up the cupola were astonishing. We obtained results in three different ways, all of which helped to cut down the cost per pound at the spout. First.—We got softer and better iron, for the soft blast did not change the iron a particle. Second.—We melted more iron per pound of coke; and third, the fire bricks in the cupola lining lasted twice as long on account of the very soft blast required, which averages from 1½ to 3 oz. in the wind box. Another economy was the saving in the attendants' time. After this cupola had run continuously from 7 o'clock in the morning till 5.30 in the evening, with only a half hour for lunch, it would drop as clean as some cupolas I have seen where only 12 to 15 tons had been melted.

*(Drummond, McCall & Co., Toronto.)

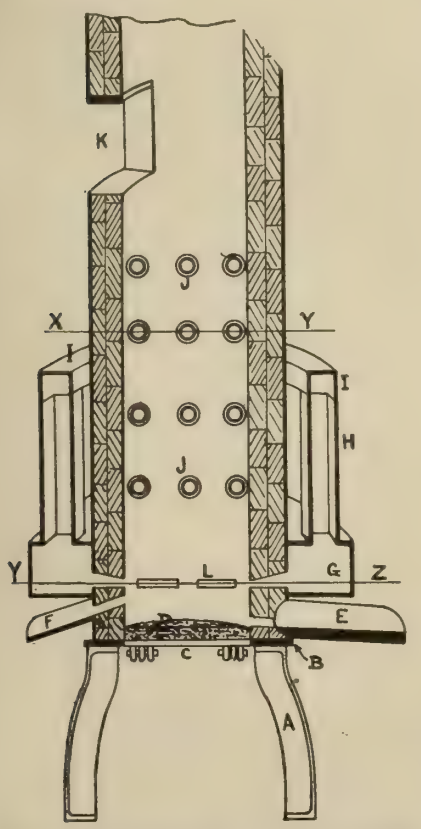


FIG. 1. MELTING IRON IN FOUNDRIES.

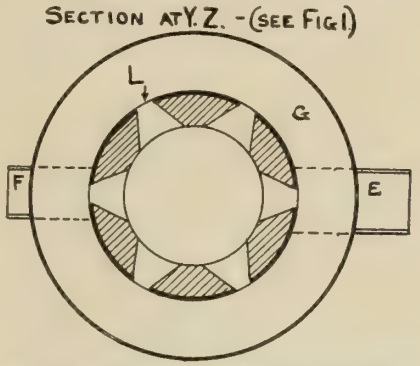

FIG. 2. MELTING IRON IN FOUNDRIES.

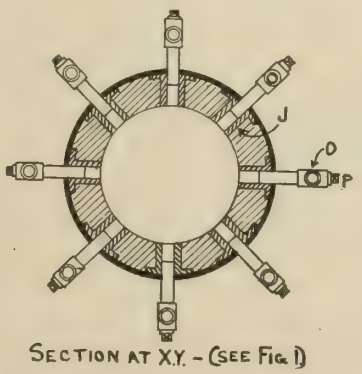

FIG. 3. MELTING IRON IN FOUNDRIES.

Almost any cupola can be remodelled into this form, as it makes no difference what the lower wind belt—(G.G.) Fig. 1, 2 and 7 is like, so long as it is large enough to supply a sufficient volume of air for the lower tuyeres—(L.), Fig. 1 and 2), and the auxiliary tuyeres (J.), Figs. 1, 3, 4, 5 and 7. The lower tuyeres (L.), and lower wind belt (G), shown here, are much the same as in the majority of cupolas. There are, however, a large number of cupolas that have not enough tuyere area. (See footnote.)

Fig. 1 shows pipes (H.H.), of which there are two to carry the air from the lower wind belt to the auxiliary wind belt (I), Figs. 1, 4 and 7, which latter supplies the auxiliary tuyeres (J) through pipes (O.)—Figs. 3, 4 and 7, which run perpendicularly above and below the auxiliary wind belt. Pipes (O) are made up from short lengths of gas pipe with a four way connection opposite, or in front of, each tuyere, with a plug (P), Fig. 4 screwed in, so that in case any of the tuyeres should become stopped up, the plug can be taken out and a small rod pushed through.

A plug (P) is also put on each end of pipes (O). The auxiliary tuyeres, set in the lining, are made of cast iron, and are shown in Fig. 5. The construction is such that they cannot work loose. They have a 1-inch hole through them, and require to be of same length as the thickness of the cupola lining, so as not

Note.—The combined tuyere area of a cupola should be equal to three times the area of the outlet of the blower, when the blower is of proper size, and it takes from 30,000 to 35,000 cubic feet of air to melt one ton of iron.

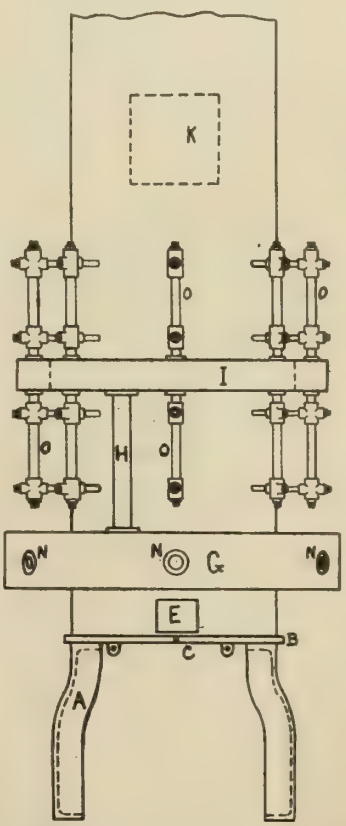

FIG. 7. MELTING IRON IN FOUNDRIES.

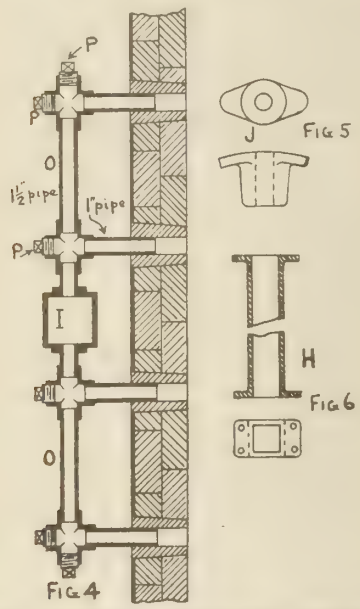
to project past the brickwork inside the cupola. Four rows of these auxiliary tuyeres are required, and the number to a row will of course depend upon the size of the cupola, as it is only necessary to supply enough air to ignite the oxygen and make full use of the escaping fuel gas which would otherwise be lost with the ordinary type of cupola.

The blast pipes enter the lower wind belt in the usual way and are not shown



FIGS. 4, 5 AND 6. MELTING IRON IN FOUNDRIES.

in Figs. 1 and 7. The peep holes opposite each of the lower tuyeres are indicated at (N.); the legs at (A.A.); the bottom plate at (B.); the bottom doors at (C.); the sand bottom at (D.); the spout at (E.), and the slag spout at (F.). All of these are in accordance with regular practice and general type of cupola.

Electrical Motor Trucks.—The management of the Canadian Express Company have inaugurated a new era in transportation of expressage by installing in their service a number of electric motor trucks. Three are of two-ton capacity and two of one-ton capacity. These have a speed of from 10 to 12 miles an hour, which is more than double that of the old horse truck. They will travel 45 miles on a single charge. The large vehicles are 166 inches long over all and 76 inches wide. The others are 149 inches long and 72 inches wide, respectively.

FIRST PRINCIPLES OF PATTERN-MAKING.*

By T. R. Schofield.

IT would seem reasonable to deduce from the previous remarks that those concerned in the economical production of castings, in order to fulfill the requirements indicated, embodying great intricacy and precision, have no small part to play in the maintenance of progress. My concern is with the attitude of the pattern-maker to these developments, how, incidentally, the foundry is affected through him, and what can be done to insure that he shall efficiently discharge his functions as a worthy member of the advanced organization of the engineering profession.

Scope for Initiative.

The work of the pattern-maker gives more scope for the exercise of initiative than almost any other branch of engineering. It is under his hand that the work of the designer first finds tangible expression, and he is frequently intrusted with a large measure of discretion and enjoys opportunities for intercourse and suggestion with the designer. The live designer does not despise his suggestions, and the tangible expression above mentioned often takes forms which render it almost unrecognizable to the designer, who has to take him somewhat on trust, and in whom are induced feelings of respect (I had almost said awe) because of the uncertain factors which seem to surround the evolution from drawing to casting.

Many of the qualities which characterize the designer are also found in the successful pattern-maker; both perform certain duties which are but steps toward a final achievement; the actual work of each has no place in the finished product, and for this reason both enjoy the distinction of being called "non-producers." Some enthusiasts have carried the thought farther, and styled both as "necessary evils," and I have frequently heard the pattern-maker's frame linked with that of Ishmael; so that their pursuits give them ground both for mutual respect and sympathy.

Pattern Cost Feature.

From time immemorial, money spent on making patterns has been regarded in many quarters as lost beyond recall. Certainly money spent on superflous or unnecessary work in any department is loss, but the necessity which exists for efficient patterns surely displays the inconsistency of such an attitude. The foundations of true economy must be laid, not upon such prejudice as above mentioned, but by paying the same attention to the equipment of the pattern-shop and the methods of producing the patterns as has proved so successful in the productive departments.

A pattern is a tool provided for the molder's use, but unlike most tools, it is used in a somewhat spasmodic manner. Such patterns as are used more or less continuously, i.e., standard patterns, are worthy to receive every possible attention, regardless of cost, since this is relatively small. Most patterns, however, are not used so frequently, and for this reason the relative cost increases accordingly. In any case, good castings, involving minimum labor in the foundry, and with allowances so fine as to require the minimum time for machining and fitting, demand patterns made to some recognized standard of quality. When the saving in first cost of a pattern is outweighed by the cost of extra labor in the foundry, the pattern ceases to be a cheap one.

Pattern Relation to Foundry.

The desirable quality of a pattern, then, is measured by the facility with which the mold is produced from it. Its purpose is strictly utilitarian, and superfluous work is to be deprecated. Such a criterion might be applied to some of the ill-considered, rough, or "jerry-built" apologies with which the molder is painfully familiar, and I think it will be agreed that there is still scope for improvement. With a reasonable standard of efficiency adopted, the cost need not be prohibitive if proper equipment is provided and up-to-date methods adopted to produce the patterns. In analyzing the various operations necessary to make a pattern, it is my intention to show in how many ways mechanical operations can be used instead of hand operations, with an enormous reduction in cost. Where a broad view of economy in pattern cost is taken, so as to embrace the foundry and subsequent departments handling the work, a higher standard of finish is secured in the castings, production is enhanced, and the foundations laid for realizing more fully the great potentialities of the foundry.

The Pattern-Makers' Work.

The work of the pattern-maker might be roughly divided under the following heads:

1—Planning or previous study of methods.

2—Machine work of sawing, planing, turning, etc.

3—Setting out and building.

4—Hand-work of paring, carving, filleting, glass-papering.

As previously mentioned, the method decided on from preliminary study of the drawing has more than a passing interest to the foundry concerned, since that department ultimately suffers from

*From a paper presented at the recent annual convention of the British Foundrymen's Association.

errors of decision at this juncture. A thorough study of the drawing by the foreman pattern-maker enables inconsistencies in design to be corrected, and modifications to be made to simplify the work both in pattern-shop and foundry. For instance, the hollow box section, beloved of machine designers, frequently necessitates cores either suspended in the cope, or insecurely balanced on chaplets in the drag, these chaplets often being cast into faces requiring to be machined, thus adding to the troubles of the machine-shop.

Pattern-maker and Designer.

A timely suggestion being made, the designer cannot fail to appreciate the force of the argument, and small but sufficient apertures are provided, insuring proper support in prints for the core, efficient venting, and satisfactory results. Instances could be quoted where, from a simple suggestion, the whole design has been altered, with a considerable gain in all-round efficiency.

The planning of the patterns must be, above everything, thorough, and embrace all the essentials of the construction and subsequent molding; the foreman's decisions should be modified, as occasion arises, by consultation with the foundry head, whose advice and co-operation are of prime importance in securing the best results, and in avoiding those vexatious alterations to patterns often made necessary when found unsuitable to foundry conditions. This preliminary work done, the job can be put in hand, accompanied by explicit instructions; the pattern-maker can proceed in the most direct manner with the work, unhindered by doubts or fads, progressing more rapidly with it than if it were imperfectly thought out and difficulties left to be overcome as they presented themselves, which is not the modern way.

It is a mere commonplace to say that economical production is secured in any branch of business by a proper planning beforehand of the work to be done, and possible difficulties as far as possible anticipated and provided for. In work of a more or less intricate nature, involving the use of many cores, a full-sized layout of the job on a board proves most helpful. Machining allowances can thus be shown; troubles in connection with the swelling of baked cores can be to some extent provided against by allowance for this being indicated on the layout, and the energy expended in rubbing cores to fit prints can be reduced if not eliminated.

With the use of a layout, a large job may often be sub-divided to advantage, individuals each handling separate units which together make the complete pattern. By this means, precise methods of execution can be employed, and much economy of time effected.

Pattern-Making Machinery.

The machines provided for the use of pattern-makers are the same general type as usually applied to woodwork, and include machines for sawing, planing, turning and grinding, among others. All of these are a practical necessity where a fair quantity of work is handled. Machines specially adapted to modern shop needs are available, and only require intelligent handling to justify their installation.

Circular Dimension Saw.

The modern circular dimension saw is a precision tool; it carries two saws on separate spindles, capable of being operated alternately, by means of a hand-wheel movement. The height of the saw above the table is adjustable from zero to about 4 inches; the fences or work guides for ripping, and cross-cutting, and the work-table itself, are designed to make the machine as universal in application as possible, each being capable of an angular movement of half a right angle, a few seconds only being required to set up for a job. These features enable straight work to be sawn dead to size and angle, and worked into the job without the necessity of an intermediate handling. For example, a framed core-box is made in a few minutes, with the ends cut off to the correct length with allowance for draft, and checked into the sides. Polygons for hollow cylindrical patterns, and the lags for the same, require very little further attention; in fact, these machines are so valuable that one is led to think that it might be an advantage to have a small edition of them placed at the end of each bench, ready for the thousand and one jobs on which it is prepared to demonstrate its effiicency.

The Planing Machine.

The planing machine is so familiar as to need little comment. We rarely find means provided by which timber may be planed to parallel thickness; where jointer and thicknesser are provided, either separately or combined as one machine, hand work of this kind is almost eliminated. If due care is taken of the cutters, many jobs such as wheel rims and other circular members may be built up with good joints, without any hand planing whatever, a matter which is worth considering as one of the many economies that can be effected.

The Sanding Disk.

To sandpaper one's work to shape was anathema to the preceding generation of pattern-makers; we are now, without shame, grinding to shape a big percentage of our work, large and small, on the sanding disk, with results satisfactory to all concerned. The saving in cost is enormous, and its use enables many novel modes of construction to be applied, which, with the invaluable aid of leather fillets, secure the desired form and finish in a much more direct manner than is possible with hand labor. No pattern shop is complete without the sanding disk; it would be impossible to enumerate in how many ways it is advantageous, for it embraces in its scope nearly every detail of a pattern. That it is not a toy may be gathered from the fact that wheels of all sizes, up to a foot wide, are ground to shape, with correct draft, from the rough, with a speed which puts the lathe to shame.

The lathe.

The lathe has been put partly out of commission with the advent of the sander, but has been compensated in our case by a suitably large face-plate and tilting table attachment, thus combining in one machine the functions of both, and forming an inexpensive and efficient arrangement. One might also mention in passing that lathes with wooden beds are not ideal for doing good work. Cases have been known where work a little too large has been accommodated by relieving a little out of the lathe bed; such a practice pursued for long can only end in disaster. Even where iron beds are provided, one looks in vain for the slide rest, which is as invaluable for turning wood as for most other materials, where precision and time are of importance. One can only wonder, and hope for the best.

Pattern and Casting Relation.

It has always seemed to me, since a casting cannot be more accurate than its pattern, that the pattern deserves every care devoted to insure that faces shall be truly perpendicular, and shaft centres bear their proper relation to each other and to the faces. To insure this, the setting-out tables of the fitting-shop, with accessories in the form of angle-plate and scribing block of adequate size, are an absolute necessity in the pattern-shop. Where these facilities are provided, the work of building up the pattern, whether it be a wheel rim or a machine or engine bed, is greatly expedited; machining allowances can be cut down to a minimum, and, in short, all the advantages realized of using precise in place of rule-of-thumb methods.

In the foregoing remarks I have tried to show that foundry efficiency demands a high standard of quality and completeness in the pattern. Also that patterns capable of meeting this demand satisfactorily, while insuring castings on which a minimum of labor is necessary to machine and assemble, need not be prohibitive in cost, if methods are studied and equipment adapted to suit present needs.

THE TUOHY BOLTLESS INTERCHANGEABLE FLASK AND FLASK BAR.

THE Tuohy boltless interchangeable flask and flask bar, illustrated herewith, can be so combined as to make up and bar any size flask from 24 inches square upward, advancing in widths and lengths by steps of 6 inches. This is accomplished by employing flask sides and ends of varying lengths provided with suitable sockets, the system being rigidly held together by simple wedges. The bars are likewise secured by double finger wedges. Neither bolts nor rivets are employed, and a common hammer is the only tool required to assemble the parts or to knock them down.

The flask and bars when in place are as rigid as those in a bolted flask, and, it is claimed will not shake loose under the most severe punishment. The bars can be raised or lowered in the flask to suit the pattern. They can be placed lengthwise or crosswise, and short bars can be inserted between the larger ones. In other words, the most complicated systems of barring, for straight work or for cheeking or chucking molds can be built up as fast as a man can move and drive in the wedges. All this is accomplished with the flask in place on the bottom board over the pattern.

Flask shop labor and material can thus be lowered very considerably and bottom board equipment is reduced to a minimum. The bars are applicable to wooden flasks, it being only necessary to cut oval holes in the sides to accommodate the finger wedges. By the employment of this bar the usefulness of the jarring machine is greatly increased for jobbing work, as copes can be as readily put up on the machine as can drags.

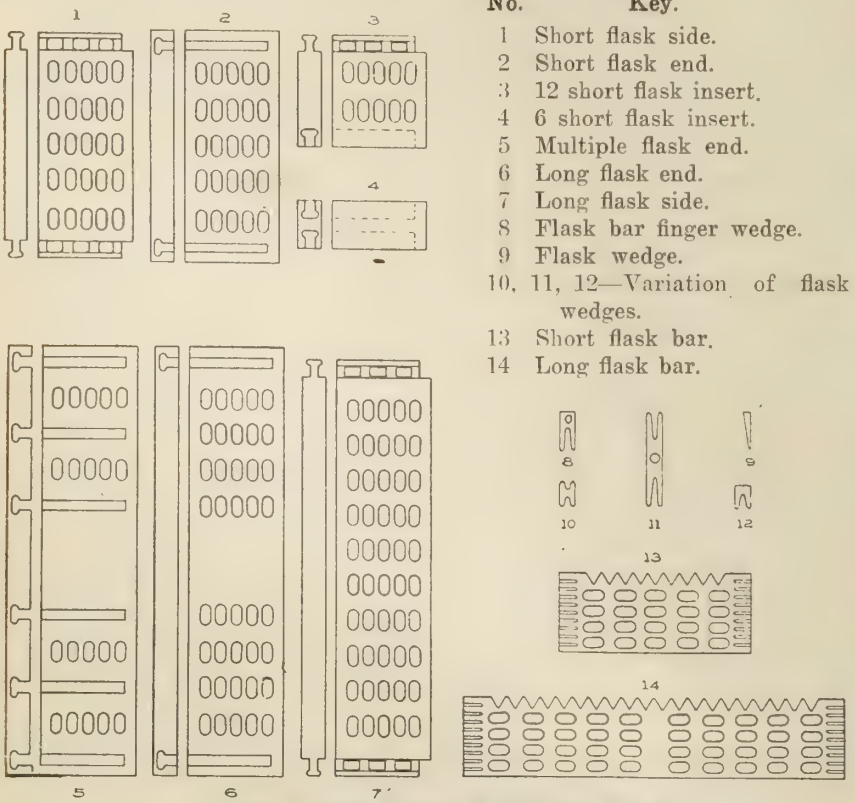

FIG. 1. THE TUOHY BOLTLESS FLASK.

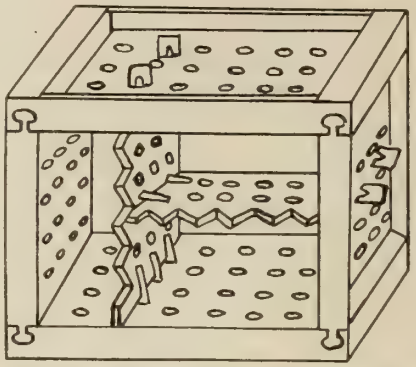

FIG. 2. THE TUOHY BOLTLESS FLASK.

This has, heretofore been impracticable, owing to the expense for barring copes. The flask parts, bars and wedges are unmachined, rough castings only, and can therefore, be made at a lower initial cost than the common flask and bar in general use to-day.

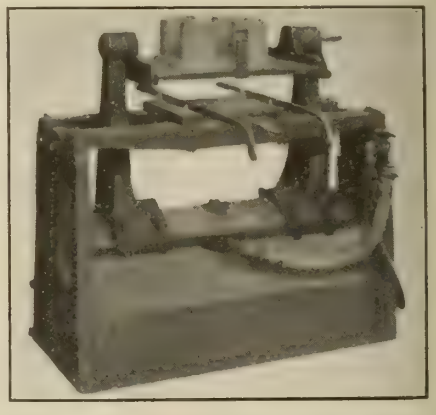
Referring to the cuts, Fig. 1 shows the various unit bars by a combination of which any size flask can be made up. Fig. 2 is a perspective view of a 24-inch flask, and serves to show how the sides and ends are interlocked and the manner in which the bars may be fixed in any desired position by means of the oval holes in the flask and the finger wedges shown in Fig. 1. The following table gives a key to the various units shown in Fig. 1:—

No.	Key.
1	Short flask side.
2	Short flask end.
3	12 short flask insert.
4	6 short flask insert.
5	Multiple flask end.
6	Long flask end.
7	Long flask side.
8	Flask bar finger wedge.
9	Flask wedge.
10, 11, 12	Variation of flask bar wedges.
13	Short flask bar.
14	Long flask bar.

This flask is patented by John Tuohy, Pittsburg, Contra Costa County, California, and was shown at the exhibition held in connection with the recent Foundrymen's convention at Buffalo. Mr. Tuohy does not manufacture the flask, but sells the shop rights to any foundry desiring to use it.

A NEW JOLT MOLDING MACHINE.

AT the recent Foundrymen's Convention held at Buffalo a new direct-draw roll-over jolt moulding machine exhibited by the Osborn Mfg. Co., Cleveland aroused considerable interest. The machine, here illustrated, has a maximum pattern-draw of 10 inches and can be adjusted to take any size of flask from 10 to 30 inches outside length, and any width up to 24 inches. This adjustment is accomplished by clamping the trunnions supporting the flask, or core box, any desired distance apart on the wide crosshead attached to the ram. The arrangement may be clearly seen from the cuts, which also show the manner in which the one cylinder serves both for jolting the mould and drawing the pattern. The mould is easily rolled over by hand, since it revolves on an axis passing close to its centre of gravity. A simple locking device holds

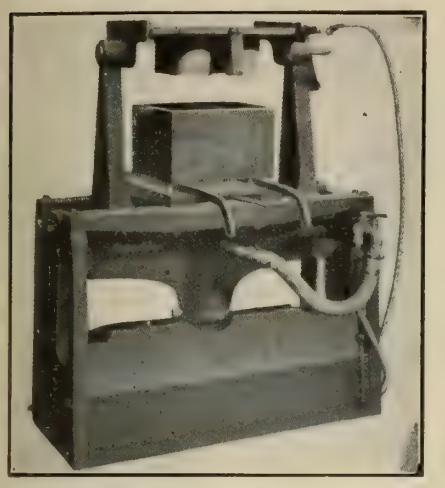


OSBORN DIRECT-DRAW ROLL-OVER JOLT WITH PATTERN MOUNTED AND READY FOR THE FLASK.

the mould in perfect alignment during the drawing of the pattern, the accurate draw making the machine very suitable for small deep castings such as are used in automobile and similar work. The table is equipped with an automatic four pin levelling device which takes up any inequalities in the follow-board. These levelling pins are all locked simultaneously by one lever. As may be seen the flask rests upon sliding steel arms and is thus easily drawn out clear of the table and removed when the pattern has been drawn.

Though exhibited this year for the first time, the machine is by no means in

the experimental stage, but has been in active operation for three years in the plant of the Ferro Machine and Foundry Co., who are large makers of automobile



OSBORN DIRECT-DRAW ROLL-OVER JOLT WITH MOULD RAMMED AND PATTERN DRAWN.

castings and internal combustion marine engines.

In addition to the machine here described, two larger sizes are made for heavier work.

ZINC SMELTING.

IN the ordinary practice of zinc smelting, the tendency in Europe during recent years has been to drive the furnace harder and harder. A furnace temperature of 1400 deg. Cent. was once thought to be high, but now 1500 deg. Cent. and upwards is reported. Such high temperatures imply, of course, the necessity for much more substantial furnace construction and a high class of refractory material. Naturally, the average life of the retorts is reduced. The actual smelting temperature, i.e., the temperature inside of the retort, is about 100 deg. to 200 deg. less than the furnace temperature. In this particular, the electric furnace has the advantage that the full temperature of the furnace is realized in just the place where smelting is to be done. The amount of zinc remaining in the residuum, whether the latter be an ash (loose or clinkered) or a slag, depends primarily upon the temperature of the smelting and the fluxing of the ore.

Conditions favorable to low zinc retention are high temperature and highly calcareous slag. It is possible to discharge from the electric furnace a slag containing less than 1 per cent. of zinc. Such slags have been made at McGill University, and other experimenters also have done so. The ability to do this does not, however, imply either commercial feasibility or advisability. It may be impossible to maintain a furnace in continuous operation under the conditions necessitated by the production of such a slag. This matter has not yet been worked out.

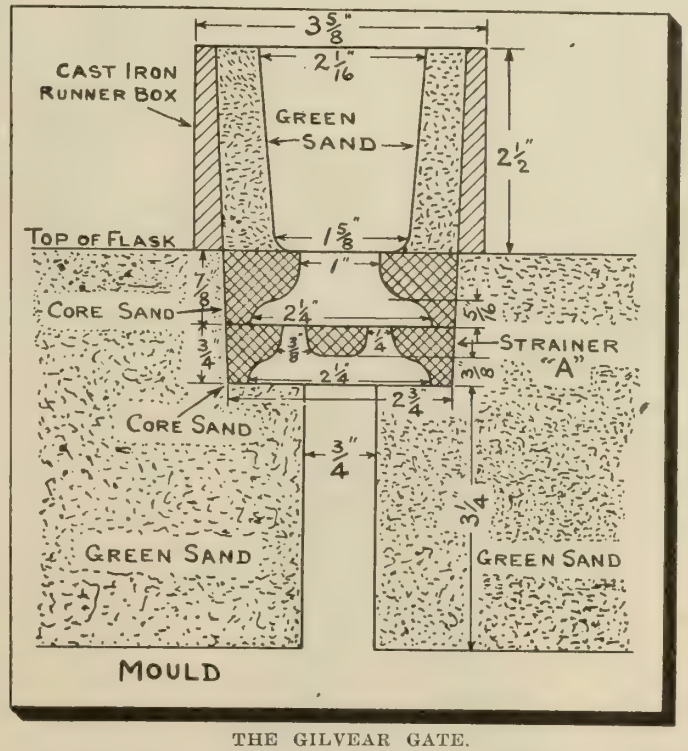
A BRASS FOUNDRY KINK.

IT not infrequently happens in the best regulated brass foundries that a pot will "freeze" just before pouring, and the common practice of running this metal into a "pig" or "buttons" is not only wasteful but unnecessary. Small pieces of phosphor tin should be kept at a convenient place, easily accessible to the flowmen and should a pot freeze even after it has been skimmed, drop a piece of phosphor tin into it and stir to the bottom. The metal will immediately flow freely and the introduction of the phospor tin will not materially affect the mixture, but will, if anything, make the masting more fine grained, and clear. The quantity of phosphor tin required to produce the desired result will, of course, vary with conditions, but as a rule a piece of about 2 ozs. will "boil" 100 lbs. of metal.

THE GILVEAR GATE.

THE skim gate herewith illustrated was devised after much experiment by Mr. T. H. Gilvear, Foundry Superintendent for the Berlin Machine Works, Ltd., Hamilton, Ont. It is made in two sections out of core sand; a third section, consisting of a cast-iron runner box suitably lined with green sand, being superimposed upon the other two. The lower section (A), known as the strainer, has ordinarily three holes in it for the metal to strain through. The size illustrated is used for castings averaging 50 lbs. in weight; but the gate may be made large enough, and with additional strainer holes to pour pieces even up to 400 lbs.

By the use of this gate experienced moulders can confidently count on 95 per cent. of good castings for machining. The dirt in the iron, particularly in the first few drops poured, cannot penetrate into the mould, it being thrust aside in the strainer by the clean and faster flowing iron that follows. In the Hamilton foundry of the Berlin Machine Works, some hundreds of these gates are now used daily; and in consequence, the reduction in the number and weight of bad castings has been almost phenomenal.



THE GILVEAR GATE.

The Canada Steel Co., Ltd., Hamilton, Ont., are about to make extensive additions to their present plant at an estimated cost of about $75,000. The new building is to be 300 feet by 40 feet, and will accommodate four stands of 3-high mills and pinions. These will be used chiefly for rolling down billets and for rolling the high carbon reinforcing bars in which the firm specializes to a large extent. The shipping department has recently been enlarged by 110 feet and the stock shears have been placed there. The railroad siding for the new mill is already provided and building will commence immediately.

Trade Gossip.

Mr. W. S. Atwood, chief engineer of the Canadian Car & Foundry Co., Montreal, is now recovering from a nervous breakdown. He has been off duty for over three months.

Stratford, Ont.—An addition to plant is planned for the Canada Iron Corporation. Output of plant to be increased from 150 to 225 car wheels per day. Addition 75 x 75 reinforced concrete.

Messrs. Royce, Ltd., Lumsden Building, Toronto, recently booked an order from the C.P.R., covering a 10-ton overhead travelling crane, for the Angus Shops, Montreal.

Mr. C. J. Walker, formerly buyer for Messrs. Lewis Bros., Montreal, has resigned his position to become Montreal manager for the Canadian Tungsten Lamp and the Ontario Lantern & Lamp Co.

New Incorporation. — The Standard Steel Construction Co., Ltd., Toronto, has been incorporated with a capital of $200,000. Messrs. A. and J. P. MacGregor and Mr. A. E. Wilson are provisional directors.

Mr. Tinsley Waterhouse, managing director of the Skefko Ball Bearing Co., Ltd., of London and Luton, England, is now in Canada and has arranged for the Canadian Fairbanks-Morse Co. to carry their lines in Canada.

The Canadian Domestic Engineering Co., Ltd., have opened a branch office in Winnipeg, to handle its Western business. This company has a very large contract in hand for the new Parliament Buildings at Winnipeg, Manitoba.

Burst Flywheel.—By the bursting of a flywheel at the Manson Campbell factory, Chatham, on October 23, the engineer was seriously injured. The wheel crashed through the kiln wall, wrecking the engine room in its course and scattering fragments of machinery in all directions.

The Linde Canadian Refrigeration Co., Ltd., Montreal, have been appointed sole Canadian agents for Kynoch, Ltd., Birmingham, England, for the sale of their gas engines and gas producer plants. Hitherto there has been some difficulty with British gas plants on account of the difference between British coal and the hard American coal used on this side, but this has now been overcome, and Kynoch, Ltd., will manufacture a plant specially designed for use in Canada.

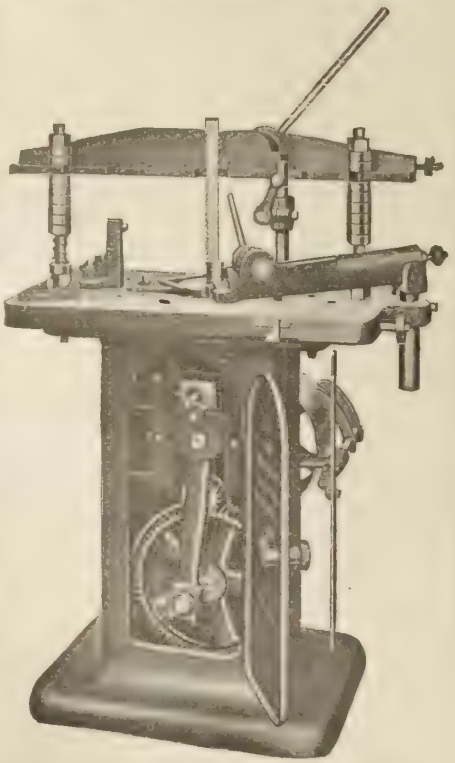
Redcliff, Alta.—A number of Medicine Hat business men have made arrangements to launch at Redcliff, Alta., the Redcliff Rolling Mills & Bolt Co., with a capital of $250,000. A practical man has gone East to purchase the machinery, and plans for the building are being prepared. It is expected that the plant will be in operation next spring. This company will turn out all kinds of angle, bar and channel iron, bolts, nuts, etc., and is expected to employ at least 75 men from the start.

Baldwin Locomotive Works.—The Baldwin Locomotive Works is running at a productive output close to the largest in its history. The company is now employing at the Philadelphia and Eddystone, Pa. plants more than 18,000 men, and has a payroll of $265,000 per week. The officials of the company declare that there is an abundance of work ahead for both plants.

Messrs. Thos. Piggott & Co., Ltd., general engineers and contractors, of Birmingham, Eng., have recently supplied large quantities of steel pipes to Canadian order, among their contracts being an order from St. Boniface, Man., for 5,081 feet run steel piping, 24 in. diameter and ⅜ in. thick; and from Vancouver, an order for 7,000 feet run, 20 in. diameter, and 2,000 feet run 24 in. diameter, 5-16 in. thick. They have in hand a contract for Vancouver for 12,000 feet run of 24 in. diameter by 5-16 in. and 12,000 feet run of 24 in. diameter by ¼ in.

Key-seating on the Davis

It becomes a simple operation as well as accurate and economical.
The feed is governed by a rack and pinion in the clamping arm and can be quickly set for rapid and accurate duplication. You can move the cutter so that its centre will cut the centre of the work without moving or readjusting the piece after it is once set.
A catalogue giving full details will be sent on request. A postal will do.



Send for Treatise on Key-seating—mailed free on request.

W. P. Davis Machine Co., Rochester, N.Y., U.S.A.

"Galt" Screws stand for Accuracy

A few reasons why Galt Screws are better.

1. They are made of the best material.
2. They are **absolutely concentric,** that is to say the threads and bodies of the screws have a common centre, therefore turn in straight and true.

Send us your blue prints for prices on special screw machine products. We can make good delivery.

GALT MACHINE SCREW CO., LIMITED

GALT, ONT.

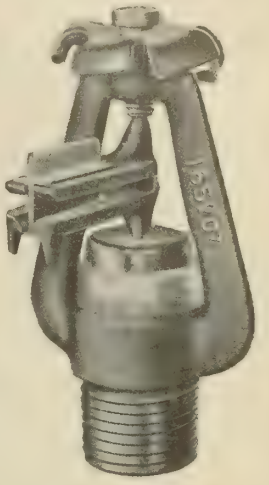
Could This Happen to YOUR Factory?

There is one sure way of preventing it. One absolutely certain system of protection that will guard your plant both day and night, and **cut your insurance premiums in half while doing it.**

That way is to install **MANUFACTURERS' AUTOMATIC SPRINKLERS.**

The initial cost of installing our system of perfect protection from fire is not high, and the reduction in insurance premiums it will effect will soon pay for our complete equipment and cost of installation in your factory and office.

Manufacturers' Automatic Sprinklers



Manufacturers' Automatic Sprinklers are to be found in some of the largest plants in the world, to say nothing of hundreds of smaller ones, and have many times proved their efficiency in extinguishing, before they could spread, fires which might have been disastrous.

The sprinkler heads fuse at a given temperature and discharge a deadly spray of water right into the heart of the fire, as soon as the air becomes one degree hotter than the given limit.

You cannot afford to risk your building, machinery and stock in this time of prosperity. Send for full information or for estimate—free, and free of obligation.

The Dominion Steel Castings Company, Limited

HAMILTON, ONTARIO

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

FOUNDRY AND MACHINE SHOP.

Vancouver, B.C.—Fire recently destroyed the entire building and ruined practically all the machinery contained therein of the Vancouver brass foundry. Despite the strenuous efforts to check the fire, damage was done to the extent of $5,000. The concern was owned by Arthur J. Brunk.

St. Johns, Nfld.—The new machine shops being built by the Reid Nfld. Co., on the north side of the dry dock, are being fast rushed to completion. The concrete walls are finished, and a large staff of carpenters is now at work on the roof which will be finished in a few weeks hence.

Eburne, B.C.—Contracts have been awarded for the erection of the Dominion Safe Works Foundry. The building will measure 150 by 200 feet and will cost about $22,000, exclusive of machinery. The plans were drawn by Eward Sproat, and the chief contractors are Barwick Brothers.

Welland, Ont.—B. J. McCormick, Industrial Commission has completed arrangements for the location of a large steel industry to be known as the Standard Steel Construction Company, Limited. The concern will cover forty acres of ground; will employ 1,000 hands and will manufacture structural work for buildings and bridges, turning out about 4,000 tons per month.

Vancouver, B.C.—Work is progressing on the new plant of the Canadian Northwest Steel Co. at the foot of Georgia St. on the South side of False Creek and the company expects to have it in operation by Nov. 15. The site, which will be occupied by the shops and stock yard, is 150 x 800 ft. and will be enlarged to 1,000 ft. long. The main shop will be 100 x 400 ft. and will be of steel and timber construction. The entire investment will be about $300,000 and employment will be given to 100 men in the shops and 25 in the offices and drafting room. If it is found necessary to run a night shift the number of men employed will be increased about one-half. The plant will be able to fabricate about 1,000 tons of steel a month.

Moose Jaw, Sask.—The Morley Twine and Machinery Company, will shortly erect a plant here to meet the trade of the coming year. The buildings will occupy five acres of land and give employment to 100 persons. Harry Morley is secretary-treasurer of this concern.

Montreal, Que.—What will be the largest boiler in Canada is now in the course of installation at the Canada Sugar Refinery, at Point St. Charles, near here. The heater will be 20 feet high and will have all modern improvements. Its weight, not including the brick work, will be 77 1-5 tons and it will carry a pressure of 200 pounds per square inch. Its steam development power is equal to 1,000 horse power . There are to be 420 tubes, two Babcock and Wilcox chain grates, weighing 6 tons each. The cost of the boiler is $20,000.

Watrous, Sask.—Work has been commenced on the main building of the Farmer's Machine Company here. It will be 50 by 150 feet, and when this is completed, which will be about next spring, a good sized foundry with the latest machinery will be added. H. T. Helgeson is the manager.

Owen Sound, Ont.—The town recently passed a by-law authorizing the advance of $60,000 to the Canadian Malleable Iron Company. In return for the same, the said company will erect a foundry 500 by 80 feet with a site of 30 acres. Work on the construction of the plant will commence at once.

Islington, Ont.—The Dominion Bridge Co., Montreal, Que., will erect here storage sheds, assembling and steel shops and install powerful fitting cranes for extensive railway construction in and around Toronto.

MUNICIPAL.

Yorkton, Sask.—By-laws authorizing the raising of $177,000 were recently endorsed by the ratepayers. The money is to be expended for various purposes, to construct overflow sewers, waterworks extension, and to extend electric plant, etc.

Lindsay, Ont.—The ratepayers have endorsed the by-law to raise $12,000 as a loan to the Fitzsimmons Auto Supply Company.

Bowmanville, Ont.—Two by-laws recently received the endorsement by the burgesses. They provide for the raising of $40,000 as cost of sewage and $111,000, the estimated cost of waterworks.

Pembroke, Ont.—A by-law which provides for the raising of $5,000 as a bonus to the Pembroke Box Factory recently received the endorsement of the ratepayers.

Ayr, Ont.—A by-law was passed by the burgesses here, authorizing the purchase of the electric light and power plant.

Weyburn, Sask.—The qualified ratepayers recently voted in favor of bonusing the Grand Trunk Pacific Railway.

Stouffville, Ont.—The ratepayers have endorsed the by-law to raise $35,000 as a bonus to a company for the manufacturing of furniture.

Owen Sound, Ont.—The by-law granting a loan of $60,000 to the Malleable Iron Works Company of Milwaukee was carried by the burgesses.

Medicine Hat, Alta.—The burgesses here recently showed themselves in favor of the by-law to raise $400,000 for a new water system and filtration plant.

Winnipeg, Man.—The result of the recent vote on money by-law by the ratepayers here was as follows:—Carried, to raise $500,000 for a site for exhibition; $750,000 for electric distribution; and $50,000 for public baths. The by-law to raise $1,800,000 for water supply was defeated.

Biggar, Sask.—The improvement by-law calling for the issue of debentures to the extent of $12,000 received the assent of the ratepayers.

St. Thomas, Ont.—The burgesses recently voted on the following by-laws:—to raise $15,000 as a loan to the Erie Iron Works for ten years; $30,000 as a loan to the St. Thomas Biscuit Company; $2,500 by way of a free site to Grave Vault Company. The by-law to give $2,000 via fixed assessment to the cold storage company was defeated.

Ridgetown, Ont.—The council recently endorsed the by-law to raise $35,000 upon debentures of above town for waterworks system.

West Vancouver, B.C.—The by-law to raise $100,000 to be used for the erection of wharves and to purchase a new ferry boat recently was endorsed by the ratepayers.

Revelstoke, B.C.—A by-law authorizing the raising of $10,000 to be expended in extending the local waterworks systems was recently endorsed by the ratepayers.

Township of Hay, Ont.—The council here recently met and passed a by-law to raise $18,000 by way of debentures, for the local telephone system.

Point Grey, B.C.—The following by-laws were recently passed by the ratepayers:—to raise $200,000 for waterworks system; $156,000 for school purposes; and $126,000 for road improvements.

Estevan, Sask.—The burgesses endorsed the by-law calling for the raising of $25,000 as cost of sites and warehouses for the International Harvester Company and Rumely Products Company.

Prince Albert, Sask.—The qualified voters recently endorsed the by-law calling for the raising of $125,000 to guarantee the bonds of the Great West Iron, Wood and Chemical Works, Limited.

Bow Island, Alta.—The ratepayers have voted in favor of raising money for the cost of a municipal gas well.

Prescott, Ont.—The by-law to raise $35,000 for the construction of a subway, etc., in connection with the proposed plan of the Grand Trunk Railway to locate terminals here, has received the endorsement of the ratepayers.

Port Dover, Ont.—The gas by-law, calling for the issue of debentures to cover expenses was defeated by the ratepayers recently.

New Hamburg, Ont.—The by-law to raise $40,000 as a loan to the Silversmiths, Company, Limited, received endorsement by the ratepayers.

Windsor, Ont.—It has been proposed that the city purchase new equipment for the ideal lighting plant, involving an expenditure of $20,000, and making necessary a by-law to raise this amount.

Watrous, Sask.—A by-law is about to be submitted to the burgesses whereby $10,000 is to be raised for waterworks expenditure.

North Vancouver, B.C.—It is proposed by the council to submit a by-law to the ratepayers for approval ,by which $150,000 may be raised on debentures to cover cost of public utilities improvements.

West Vancouver, B.C.—The by-law to raise $100,000 to be used for the erection of wharves and to purchase a new ferry boat recently was endorsed by the ratepayers.

Hagersville, Alta.—The burgesses recently endorsed the Hydro-Electric by-law, whereby an uncertain sum of money is to be raised.

Pincher Creek, Alta.—The by-law to raise $30,000 for a new municipal building has received the endorsement of the burgesses.

Harriston, Ont.—The ratepayers expressed themselves in favor of the raising of $11,000 for the purchase of, and in installing an electric light plant.

ELECTRICAL.

Belleville, Ont.—There is now every possibility of this city obtaining an electric railway as proposed. Work is likely to commence in the early spring upon the line which will connect with the proposed line through Prince Edward district. When complete, this line will mean much to this city as a transporting medium for the men employed in Point Ann, one of the points to be touched and where 1,000 men are employed.

Edmonton, Alta.—Three hundred miles of electric railways, connecting Edmonton with numerous towns, coal mines and gravel deposits, grain and dairy districts, brick, concrete and other manufacturing plants in central Alberta, will be built by the Edmonton Interurban Railway company. George Barbey of Paris and Vancouver, head of a French syndicate, which has already invested more than $10,000,000 in Canada, is president. The company, incorporated under the laws of the province of Alberta in 1910 and reorganized in Edmonton on September 16, 1912, is financed by French and Canadian investors. The first unit of the system ,upon which grading work is in progress, will be from the city limits of Edmonton to St. Albert, six miles. Steel will be laid the coming winter and the line placed in operation for passengers, express and light freight traffic by June 1, 1913. The initial equipment will be 1260-passenger coaches and 50 freight and coal cars. The power house, to be erected at St. Albert, will be of a capacity to operate 28 miles of road. M. Kimpe, managing director of the company, has charge of the construction work.

Peterborough, Ont.—The ratepayers will have the opportunity of voting on a by-law to raise $88,000 for Hydro-Electric purposes, on January 1, 1913.

Yorkton, Sask.—By-laws authorizing the raising of $177,000 were recently endorsed by the ratepayers. The money is to be expended for various purposes, to construct overflow sewers, waterworks extension, and to extend electric plant, etc.

Hanley, Sask.—A by-law was recently passed by the ratepayers authorizing the council to issue debentures to raise cost of the erection and equipment of an electric plant.

Campbellford, Ont.—Campbellford, the power town on the Trent River, has commenced a publicity campaign and is issuing an illustrated pamphlet setting forth the advantages it has to offer manufacturers, capitalists and financiers in the way of cheap and abundant electric power at Healey Falls, Middle Falls and the various dams. The pamphlet says that the Seymour Power Company is using 5,000 horsepower, and the municipal plant 2,500 horsepower, leaving the large surplus of 40,000 horsepower to dispose of.

GENERAL MANUFACTURING.

Peterborough, Ont.—The De Laval Separator Company are asking the city to make a loan of $19,000 to them to pay the cost of a site and the removal of the branch factories situated at St. John's and Montreal to this city. The building to be erected will be 112 by 400 feet. The new industry is under an obligation to make an initial outlay of $75,000 for buildings and equipment.

Lindsay, Ont.—The J. A. Fitzsimmons Company will commence building operations on their new factory at once. The new factory will be 126 by 43 feet, two storeys high, for which the National Concrete Company of Linsay will estimate.

North Battleford, Sask.—The Cordage Company of England, capitalized at eight million dollars, will instal a plant here employing seven hundred men.

Galt, Ont.—The fine three-storey building of the Galt Robe Company was gutted by fire which destroyed the building and stock contained therein, entailing a loss of $15,000. The

TENDERS for Motor and Pump

Sealed tenders will be received by the City of St. Boniface, Man., up till NOVEMBER 8TH, 1912, for the supply and erection of a variable speed motor and motor-driven pump capable of delivering either 1,000,000 or 1,500,000 imperial gallons per twenty-four hours.

The pump must be capable of delivering either of these quantities against a pressure of 65 lbs. (domestic pressure) and 100 lbs. (fire pressure).

The current supply in pump house is 550 volts, 3-phase, alternating.

Plans showing layout and available space may be obtained at the City Engineer's office.

Each tender must be accompanied by a marked cheque or cash equal to five per cent. of the amount of tender.

The lowest or any tender not necessarily accepted.

Tenders to be addressed to J. B. Cote, City Clerk, and marked "Tenders for Motor Driven Pump."

(Signed) J. B. COTE,
City Clerk.

Superintendent Wanted

We desire to engage an experienced, energetic and ambitious superintendent for our stove and range factory and general grey iron foundry. An excellent opportunity for rapid advancement is offered to a really capable man. No "desk superintendent" need apply. We must have a superintendent who can cope successfully with all the troubles with the cupola, troubles with the mouldings, troubles everywhere. He must be absolutely fitted to take complete charge of the technical end of the business. A man conversant with soil pipe casting preferred. The plant is about to be erected in the Canadian Northwest. Write, stating full particulars, references and salary expected. Correspondence treated in strict confidence. The Great West Iron, Wood and Chemical Works, Limited, Prince Albert, Saskatchewan, Canada.

TENDERS WANTED

FOR THE PURCHASE OF THE

W. H. Salter Structural Steel Plant

37 River Street, Toronto

The undersigned administrator of the estate of W. H. Salter, deceased, requests tenders for the purchase of this business as a going concern, including the following assets:

Real estate, consisting of 37 River Street, and factory and warehouse premises in rear, with roads, lanes, and siding rights over the G.T.R. switch to Don Esplanade. The buildings on this property consist of the dwelling house, 37 River Street, the three-storey warehouse building in rear; structural steel shop, office building and machine shop, with complete plant and equipment of same. Stock-in-trade of steel beams and other structural steel, office furniture and fixtures, book accounts and contracts in course of completion.

Also alternative tenders for the purchase of the above-mentioned assets, excluding the real estate, the purchaser taking a lease of the buildings used in connection with the steel plant.

Tenders will be received up to Saturday, the 9th day of November, 1912, at noon, when those received will be opened and considered.

Full particulars of the above-mentioned property and assets and terms of payment can be obtained from the undersigned administrator, which, however, shall not be bound to accept the highest or any tender.

Dated, 24th October, 1912.

THE TORONTO GENERAL TRUSTS CORPORATION,

Administrator of the estate of W. H. Salter (deceased).

By its solicitors herein.

Cassels, Brock, Kelley & Falconbridge,
Toronto General Trusts Bldg., Toronto.

insurance carried is about $99,000. The cause of the fire is as yet unknown.

Pembroke, Ont.—A company known as the Pembroke Shooks Mills Company, Limited, has been organized with head office here. The above mentioned company is composed of Hamilton capitalists and is capitalized at $100,000. The question of a bonus by the town was referred to the citizens who expressed themselves in favor of so doing.

St. Thomas, Ont.—Increased business has forced the Nursery Shoe Company to contemplate an addition to their present building. The minor details of the additions are not made known yet.

Battleford, Sask.—The first shipment of machinery for the new brick and cement block business being established here is now on the ground, and comprises two brick machines and one machine for the manufacture of cement blocks. The business will be operated by Mr. Erinshaw, of Winnipeg, a competent brick man, and will be in operation within a few days. It is the intention of Messrs. Lobb & Clark to put in a much more extensive plant than they at first intended, and they will accordingly add greatly to the present equipment early next spring. Arrangements are being made by the firm to establish their planing mill business here in time to take care of next year's trade.

Medicine Hat, Alta.—It is announced that Messrs. Ouim and Boucher of the Wetaskiwin Bedding Company have decided to construct a factory here for the manufacture of iron beds, springs and gates. The contract between said gentlemen and city has been signed and plans have been drawn up, making possible an early start. It will be 150 by 50 feet. Two storeys high. Forty men will be employed.

Ambo, Ont.—The Canadian Explosives, Limited, is seeking exemption from taxes for ten years and fixed taxation to be $60,000 for the entire property. The above mentioned company is capitalized at $15,000,000, and has seven plants elsewhere. Its directors consist of Messrs. William McMaster, T. J. Drummond, J. H. Plummer, B. McLennan, and C. C. Ballantyne. It is estimated that 400 men will be employed in the factory.

Forest, Ont.—Recently a joint company has been formed, capitalized at $40,000 to assume control of the present plant of local basket company.

Winnipeg, Man.—A new company known hereafter as the Canadian Motor Company has been organized and is capitalized at $500,000. E. S. Sherwood is the managing director. The above company has acquired the business lately carried on under the title of the Fort Rouge garage.

Paisley, Ont.—The local pump works, known as the Paisley Pump Works were completely destroyed by fire which is supposed to have been started by lightning. The factory was owned by Mr. Wm. Rush, and was an old land mark in this vicinity.

Calgary, Alta.—Work will be commenced within a month on a paper factory in Calgary to cost $75,000. Coarse grades of paper and cardboard will be manufactured out of straw. This will be the only plant of the kind in Canada, although there are a number of similar factories in the United States. The company that will build the plant is controlled by a Vancouver syndicate. The factory, when in operation, will employ fifty men.

Watrous, Sask.—The management of the Co-operative Laundry Company have made arrangements for the erection of a plant at this point as well as at Regina and Saskatoon. This building will cost about $30,000.

Welland, Ont.—According to a report a concern taking the name of the Empire Cotton Mills, Limited, will establish a plant in this city to cost three million dollars. The directors' names have not as yet been made public.

Toronto, Ont.—The management of the Northern Electric Manufacturing Company have been granted a permit to erect a new factory on Bay Street at a cost of $75,000.

Toronto, Ont.—The management of the American Abel Company will make an addition to their plant on Queen Street of this city. Mr. F. C. Rumely, of Laporte, Ind., U.S.A., will assume charge of the alterations.

Montreal, P.Q.—Messrs. Walter Baker Company, Ltd., have taken out a permit for the erection of an eight storey factory to cost $50,000.

North Bay, Ont.—The management of the Bogart Refrigerator Company have requested the town council to grant a free site of two acres, exemption from taxes, and a fixed water rate preparatory to their decision to erect a plant.

Simonds Canada Saw Co., Ltd.

MONTREAL, QUE.

St. John, N.B. Vancouver, B.C.

In the United States, Simonds Mfg. Co.

SAW AND PLANING MILL.

Vancouver, B.C.—A transfer was recently made of the Port Moody Saw Mill, tug boats, cut lumber, and timber limits belonging to the Emerson Lumber Company, Limited, to the National Finance Co., and the Thurston and Flavelle Lumber Company. The sale price was $500,000. The output of the mill is about 150,000 shingles per day. It also has a capacity of 75,000 feet of lumber per day.

Calgary, Alta.—A sash and door factory is about to be erected here which will employ fifty men. Already the foundation is being put in by Ed. Peterson, contractor, and within the next few weeks the building will be ready for the installation of the machinery.

Norwood, Man.—The factory of the Acme Sash and Door Company, which was recently organized, will be finished by November. The site contains two and a half acres which will be practically all taken up by buildings. At the rear a boiler room and machine shop will be erected, the machine shop having a shaving vault. The building will cost $20,000, and the plant when in operation will give work to 100 men.

Vancouver, B.C.—Fire, which originated by the emittance of sparks from the incinerator of the plant belonging to the Vancouver Lumber Company, spread until ultimately the company's dry kilns and 200,000 feet of lumber were consumed. The loss sustained is about $45,000, practically all covered by insurance.

Coquitlam, B.C.—What is claimed will be the largest mill of its kind is about to be built by the Canadian Western Lumber Company at Fraser Mills in the form of a saw mill having a capacity of 125,000 feet per day of ten hours duration and is to employ altogether about 1,000 men.

Chatham, Ont.—The planing mill here owned by William Drader was completely destroyed by fire a few days ago. The fire, which is said to have started in the engine room destroyed the whole contents of the building. The loss of which is not covered by insurance.

Grand Rapids, Sask.—What is known as the Demus-Canadian Lumber Company was recently organized here. The company is capitalized at $500,000 and owns tracts estimated to contain 800,000,000 feet of lumber. The said company will shortly erect a mill here to cost about $370,000.

Toronto, Ont.—Mr. Justice Neville to-day approved of the scheme of reconstruction for the Dominion Saw Mills and Lumber Company. This provides for voluntary liquidation of the company and the formation of a new concern, which will shortly issue $1,000,000 six per cent. debentures and half a million one-dollar shares.

Fort Frances.—The Shelvin-Clarke Lumber Company is building two mills with a total capacity of 100,000,000 feet of lumber a year. In the plants 550 men will be employed. The pay roll will be $35,000 at least a month.

BUILDING NOTES.

Victoria, B.C.—The Hudson's Bay Company propose to erect at an early date a large store here. It will be modelled after Harrod's Stores in London, England, with all the facilities to meet the Canadian requirements.

Toronto, Ont.—Before a large assembly of University dignitaries and old time students the corner-stone of the splendid edifice of Knox College was laid by the Governor-General of Ontario recently. The building which is a fine example of architecural design will cost about $500,000.

Niagara Falls, Ont.—An addition is about to be made to the General Hospital which will cost about $300,000. The cost will be covered by the legacy left by Susan Thompson.

Moose Jaw, Sask.—Work has commenced on the building of the Saskatchewan Creamery Company. The whole plant will represent an outlay of $100,000. The building will be two storeys high, 60 by 100 feet and have full basement. Two fifty horse power boilers are to be installed. Electric power will be used, but steps have been taken to provide steam power in an emergency.

Toronto, Ont.—A twenty-nine roomed school is about to be started at Kew Beach and will cost about $150,000. This sum will be solicited from the Board of Education by the property committee.

Edmonton, Alta.—A new civic building is now under construction here, which is estimated to cost $225,000. The building is to be fire proof, the materials used being steel, concrete, brick, and terra cotta. Altogether the structure will cover 20,000 square feet. D. M. Jeffrers is the architect.

Port Arthur, Ont.—A new company has recently been formed in Port Arthur under the name of the "Port Arthur Housing Corporation, Limited," with a capital stock of $250,000, divided into $100 shares .

This company has been promoted for the purpose of overcoming the lack of suitable housing accommodation. Plans have been prepared of a three-storey apartment house, giving each family two bedrooms, a living room, kitchen, bathroom and pantry. It will be brick-veneered and well built, with iron fire escapes.

Winnipeg, Man.—The Lombard Building Co., Ltd., a concern recently formed to finance the project, will erect a fourteen storey office building to cost, with the property, in the neighborhood of $960,000, at Lombard and Rorie streets. It will have a frontage of 120 feet, a depth of 90 feet and a rental floor space of about 120,000 square feet. Work commences as soon as the specifications can be prepared and the contract awarded.

Grimsby, Ont.—Tenders are being called for the construction of a new post office here. It is to be 72 by 40 feet, with a tower 64 feet in height. It will be of red brick and two storeys high with a basement.

North Vancouver, B.C.—Work on the construction of the Grouse Mountain observatory, which will be erected by the government, will start within a year according to private advices received here from Ottawa. The announcement of its construction was only given out recently It is understood that Mr. T. S. H. Sherman, director of the Vancouver meteorological station, will have charge of the observatory. Plans are not drawn as yet, but these will include the erection of equipment which will equal any that can be found anywhere on the coast.

Winnipeg, Man.—A large addition to the General Hospital here is being made, involving an outlay of $625,000. The work, which was started a year ago, consists of building two wings. Each six storeys high, 64 feet wide and 160 feet long. When it is completed, which is expected will be next May, the entire institution will be able to provide for 550 patients.

MISCELLANEOUS.

Brantford, Ont.—The Ontario Government has appointed the Canadian Domestic Engineering Company, Limited, of Montreal, as engineers for the heating, ventilating, etc., of the new Brantford Asylum for the blind.

Winnipeg, Man.—The Canadian Domestic Engineering Company have been appointed consulting engineers for the heating, plumbing, ventilating, electric works and central power house equipment of the new parliament buildings, Winnipeg, Manitoba, involving an expenditure for the buildings of approximately $5,000,000, and for the engineering work of $800,000.

Montreal, P.Q.—Messrs. Heap and Partners (Canada), Limited, have secured a contract from the Board of Control at Ottawa, for three Rees Roturbo motor-driven pumps with a total capacity of 45,000,000 gallons per day.

Point Grey, B.C.—The municipality are calling for tenders for the supply of about 33 miles of steel pipe, to be received until December 2nd, 1912 . Particulars may be obtained at the office of the water superintendent, Municipal Hall, Kerrisdale (Vancouver), B.C. Ben. A. Cunliffe, clerk municipal council, Kerrisdale, B.C.

Quebec, Quebec.—According to advices from Quebec, the Government will build the proposed dry dock, which will be operated by the Shipping Federation. Probably it will be constructed on the south side of Levis. Mr. William Price is to be appointed chairman of the reorganized Harbor Board.

Montreal, Que.—The city of Montreal has awarded the contract to instal three vertical centrifugal pumps for handling the sewage from low level to high level to Drysdale & Co., Glasgow, for whom J. T. Farmer, Montreal, is Canadian agent. The pumps which will lift the sewage about 18 feet, are each of 27 cu. ft. per second capacity, and are operated by 80 H.P. 550 volt A. C. Bruce-Peebles motors. The motors are automatically controlled, being switched in and out by float arrangement; either one, two or all three pumps being capable of operation as required.

Shawinigan Falls, Que.—The Shawinigan Water and Power Company are installing a third generator set of 15,000 kw., at Shawinigan Falls. The generator is being built by the Canadian Westinghouse Co., at Hamilton, while the transformers will be supplied by the Canadian General Electric Co., and the water wheels by the I. P. Morris Co. It is expected that the unit will be running by February 1st, 1913.

Chesterville, Ont.—A by-law was submitted on October 25th, asking authorization to close a contract for light and power with the Ontario Hydro-Electric Power Commission.

Cobalt, Ont.—The Northern Ontario Light & Power Company is now reported to have absorbed the British Canadian Power Co., which generates some 10,000 horse-power on the Matabitchouan River. This completes the

merging of the important companies in the Cobalt and Haileybury district.

Port Alberni, B.C.—Warden & Wilkins, Williams Bldg., Vancouver, engineers, have been instructed to prepare plans for an electric plant, also to estimate cost of plant and distribution system.

St. John, N.B.—St. John Railway Company have awarded contracts for 3 500 h.p. boilers to Babcock and Wilcox, Glasgow, and for large chimney, 150 ft. high, 7 ft. 6 in. inside diameter at top, to H. R. Heincke Co., Inc., New York. Contract for engine and generator not yet awarded.

Summerland, B.C.—Engineer Latimer has reported that extensions will cost $100,000 for waterworks and $50,000 for electric lighting system.

Montreal, Que.—The Cedar Rapids Power Company has asked the shareholders to meet on November 4th to authorize an increase in the capitalization from $10,000,000 to $15,000,000. It is also proposed to effect a change in the head office from St. Joseph de Soulanges to Montreal.

The Prince Rupert Hydro-Electric Company are installing two 750 H.P. Diesel units. These will be running very shortly, and will deliver power about the beginning of 1914. There is a total of 50,000 H.P. available, but it is not intended to provide more than 5,000 H.P. until the demand for power increases. When the hydraulic machinery is in operation the Diesel units will be used as standbys and auxiliaries. These engines were built on the Continent of Europe, and are being installed by the English firm of **Dick, Kerr & Company.** They are the largest units of this type at present in use in Canada.

CATALOGUES RECEIVED.

Jenkins Bros., Ltd., Montreal, have issued the 1912 edition of their catalogue, and will be glad to mail the same free of charge to interested parties. The company are now manufacturing the well-known Jenkins Bros.' valves for superheated steam, as well as their regular line for standard, medium and extra heavy pressures. As in previous issues, packing pump valves, and other rubber specialties are also listed, and the catalogue, besides being most complete, is also very compact, measuring only 6¾x6¾ inches.

The Coventry Chain Co., Ltd., Coventry, England, whose Canadian representatives are **John Millen & Son, Ltd., Montreal, Toronto, etc.,** have mailed us copies of their catalogues D-2 and C-2. The former describes the firm's line of roller chains for automobile and general power transmission, while the latter deals with their "Noiseless" chains.

The Murphy Iron Works, Detroit, Mich., have favored us with a copy of the twenty-fifth edition of their catalogue dealing with the Murphy Automatic Furnace. The merits of this popular furnace are too well known to render their enumeration necessary here. Suffice it to say that the catalogue is a most artistic production, such as is a real pleasure to peruse. The first twenty-four pages are used to explain and illustrate the construction and operation of the furnace, while the remaining forty pages are occupied by fine half-tone views of representative installations in the U.S.A., Canada, and elsewhere.

Evans, Almirall & Co., New York City, have mailed us an attractive booklet illustrating numerous large installations of the system of heating buildings for forced hot water circulation. Briefly stated, the system consists in heating the water by exhaust steam in closed heaters, and thereafter circulating it through the mains by centrifugal pumps.

PHONE MAIN 1615

AMERICAN MACHINISTS LIMITED

324 CRAIG ST. WEST, MONTREAL

The Armstrong Bros. Tool Co., Chicago, have issued Catalogue A-12 which is finely printed and illustrated. It forms a price list of this firm's well known line of drop-forged tool holders, wrenches, etc.

The Vulcan Engineering Sales Co., Chicago, have sent us a copy of their latest bulletin dealing with their smallest metal sawing machines—type IM. This is a small but powerful saw of large capacity and can be arranged for either a belt or motor drive.

The Mott Sand Blast Mfg. Co., Chicago, have mailed us a copy of Bulletin No. 115, dealing with this well known sand blast machine, the chief features of which are its great simplicity. All mechanism or working parts are located outside the tank, there being nothing inside the latter which will suffer through wear and tear and thus require renewing. Copies of this bulletin will be mailed to anyone interested.

J. W. Paxson Co., Philadelphia, has sent us Bulletin No. 28, which is recently off the press. This forms a handsome and very complete catalogue of sandblast machinery, and contains very full information on sandblasting for all purposes. The construction and operation of the various Paxson-Warren machines is clearly explained and illustrated, and taking it all round, the catalogue is one of the best that we have seen dealing with this subject.

Charles H. Besly & Co., Chicago, have issued for the benefit of users and prospective users of Besly disc grinders an interesting booklet combining the functions of catalogue and instruction book. The accuracy of the work done on a well-designed disc grinder equipped with tilting table, swiveling work holder, angle knees, etc., is of the highest class—a fact which is becoming daily more widely realized. On many lines of work the disc grinder will effect a considerable reduction in cost of output over a miller or planer and the Besly Company are always open to receive samples of castings, etc., on which they will carry out free, a production test with a view to learning the exact price for which they can be "machined" on a disc grinder. The booklet is divided up into seventeen sections and has a complete index at the end. One section explains the advantages of the new Besly pattern-maker's disc grinder with drum sanding attachment, which saves a large amount of skilled labor in the pattern shop.

The Wright Manufacturing Co., Lisbon, Ohio, have mailed us their latest catalogue of chain hoists. The Wright standard high-speed chain hoist is of the well known triplex type, the hoisting being through planetary gears cut from the solid. The main driving pinion and shaft are made of open hearth nickel carbon steel forgings and the hand wheels are malleable castings, instead of grey iron as is often the case. The load is held in any position by a positive automatic friction device but can be immediately lowered by a slight downward pull on the hand chain and is always under the control of the operator. These high speed hoists are made in sizes ranging from ½ ton to 20 tons. The company also makes a full line of screw hoists ranging from ¼ ton to 8 tons. In these, the worm is of steel, hardened and ground, while the worm wheel is of phosphor bronze. Each part of these hoists is manufactured with a high factor of safety and sold under a guarantee.

The National Tube Co., Pittsburgh, Pa., have recently issued a second and revised edition of their handsome brochure, dealing with the manufacture of modern welded steel pipe. Excellent half tones and clearly written text help one to follow the complete process from the mining of the ore to the shipping of the tubes.

W. T. Glover & Co., Ltd., Trafford Park, Manchester, Eng., have issued a leaflet setting forth the merits of a new type of protective cover for electric cables. This consists of braided whipcord, and is said to provide all the desired mechanical properties at a minimum cost, while its water-resisting finish renders it suitable for use in damp surroundings. This firm is represented in Canada by Royce, Ltd., Toronto.

W. S. Rockwell Co., 50 Church St., New York, who are well-known specialists in all types of furnace construction, have issued a new catalogue, No. 15, showing their rotary annealing and hardening furnaces for heat treatment of any small pieces of like dimensions in either brass, copper, steel or other metals.

A. B. Ormsby, Ltd., Toronto, Ont., have forwarded a copy of their handsome loose-leaf catalogue, which describes the Ormsby-Lupton "Underwriter's" steel sash. This well-known sash has great durability and rigidity to withstand wind pressure. It affords a maximum of natural lighting and also efficient fire protection.

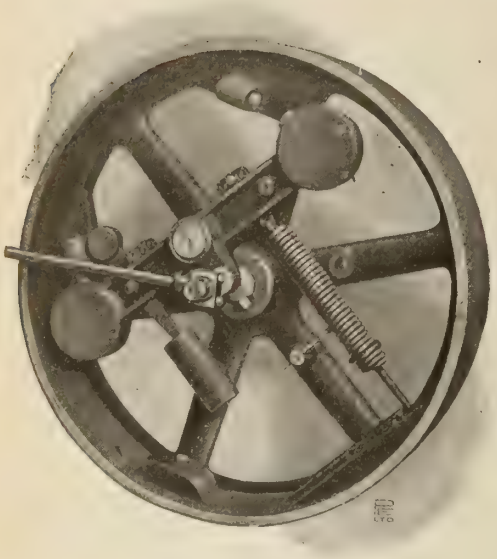
The Governor That Makes Possible Our Regulation Guarantee



Every McEwen Engine we sell is issued with a rock bottom guarantee that in plain English means "Perfect engine regulation or your money back."

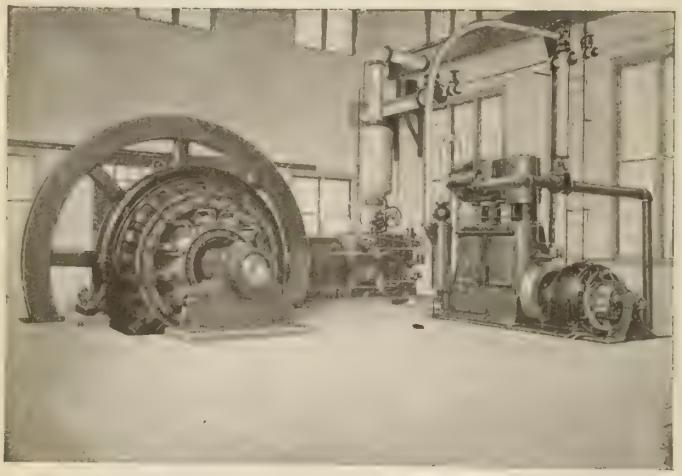
This is how it reads:—"The engine shall not run one revolution slower when running fully loaded than when running empty, and a reduction of boiler pressure from the greatest to that necessary to do the work, will not reduce the speed of the engine one revolution. Any engine failing to meet this guarantee becomes the property of the purchaser on the payment of one dollar."

McEwen Engines

The Begthrup Governor supplied with the McEwen Engine backs up this guarantee. It is shown in the cut. Simple in construction, it is easily adjusted, can be regulated to speedupunder load and still govern perfectly without the least tendency to race. This Governor is used only with the McEwen Automatic Engine. Are you buying a guaranteed engine or not?

The Waterous Engine Works Co., Limited

BRANTFORD, CANADA



EFFICIENCY

Is the main consideration in your Power Plant. There is only one way to obtain it, and that is:—

BUY THE BEST

equipment you possibly can and DEVELOP YOUR OWN POWER. By so doing you save money and in addition you have a steady service all the time. The Power is not off just when you need it the worst. Such service means EFFICIENCY.

Illustration shows H. D. Goldie Corliss & Vertical High Speed recently installed by us.

The Best Quality of Material and Workmanship

are used in the construction of Goldie & McCulloch Engines, Boilers, etc. There is nothing better made.

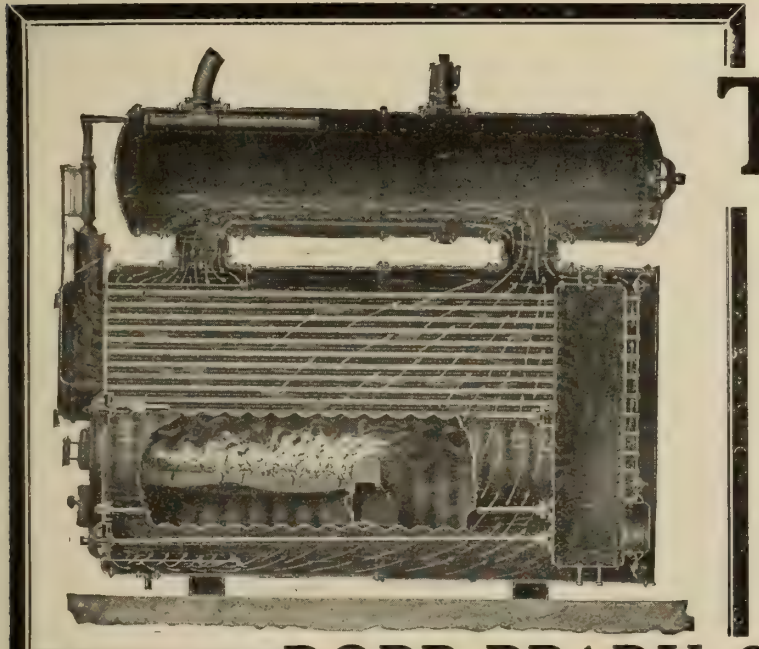
Railway Equipment Company of Toronto, Limited

1240-1250 Dundas Street, TORONTO, ONT.



TESTED

Four thermometers were placed in oil wells to show rise in temperature as the boiler was fired up. When the upper thermometers indicated boiling point, the lower thermometers rose rapidly. At 100 pounds pressure all four gave the same reading. No dead water beneath the furnaces.

A modification of the standard marine boiler, adapted to plants ashore. The chief new feature is rapid circulation. It does away with the flat top combustion chamber. Its staying is simple.

Standard Three-Motor Electric Overhead Travelling Crane

We build Cranes of all kinds---of all sizes---for all purposes.
This is our Standard Three-Motor Overhead Travelling Crane.

¶ All parts well proportioned and of rigid construction, giving large factors of safety.
¶ Over-winding device. Gears all machine cut. All parts standard and interchangeable.
¶ Fitted with liberally-rated, slow-speed motors and improved tramway type controllers.

Detailed Specifications and Prices submitted upon request.

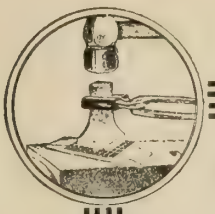
AGNEW ELECTRIC WELDER CO., LIMITED

WALKERVILLE ONTARIO



LAFFITTE

WELDING PLATES

A SCIENTIFIC CHEMICAL WELDING COMPOUND. WELDS IRON AND STEEL AT A REMARKABLY LOW HEAT.

You are not taking our products seriously enough; unless your blacksmith asks for it you never give it a thought. We can easily reach the smaller man who must consider every economy, but we cannot get at the man in your shop.

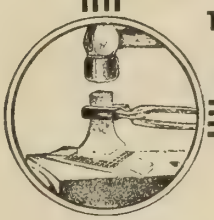
The larger you are the more you need LAFFITTE.

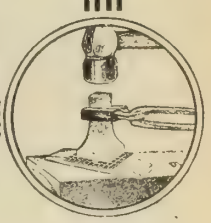
Let us send you samples. There are endless economies you can effect, and the cost is insignificant compared with the results.

DEALERS THROUGHOUT CANADA HANDLE LAFFITTE

The Phillips-Laffitte Co.,
Penna. Bldg. Philadelphia, U.S.A.

ASK FOR AND GET LAFFITTE





Another Hold-Up?

Every hold-up you have while waiting for some renewal part of your machinery causes you to waste some valuable time, and by not filling your orders promptly you will antagonize your customers so that you are liable to lose their patronage. Don't wait for renewal parts.

WELD YOUR BREAKS BY

AUTOGENOUS WELDING

REDUCE YOUR SHUT-DOWN TO HOURS INSTEAD OF WEEKS.

When your next breakdown occurs wire us. We have emergency repair outfits, and night and day shifts for the benefit of our customers.

These outfits, traveling by express, will minimize your waits, and make broken parts as strong and efficient as the original.

Every operator is an expert—our equipment is the best that it is possible to make. Nothing too large or too small for our capacity.

Prices are low in comparison with the quality of our work.

If there is a broken part of your machinery which you consider worth saving, send it to us and test the quality of our work.

We sell and install complete Welding and Cutting Plants.

It is cheaper to weld than to buy new parts. Keep us in mind. You will require our services in a hurry some day.

The Franco-Canadian Welding Co.

SPACE AND LABOR CAN BE SAVED
Through the Use of

BLOUNT'S

Grinding, Polishing and Buffing Machine

This combination does the Work as efficiently as three separate machines.
It is a well finished, modern designed machine, with self-oiling bearings throughout.
It is especially adapted for use where the amount of polishing does not require a separate machine, or where the floor space is limited.
It has proved its reliability through many years of constant service.
Let us send fuller particulars—you should be interested in a saving of this kind. Our prices are reasonable.

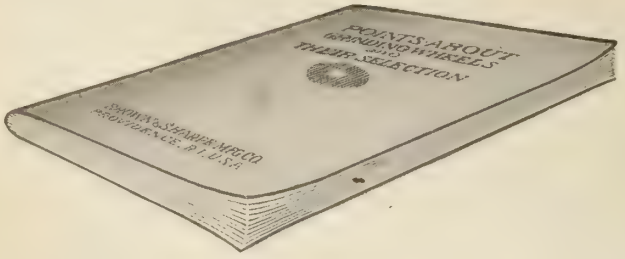
MAILED FREE TO YOU



If you are interested in Grinding Wheels, send for this interesting New Book, entitled:

"Points About Grinding Wheels and Their Selection"

This forty page, attractively and serviceably bound book treats of the subject in a concise manner, and contains information that it would be difficult to gain, short of an extensive study.
Do you know what wheels to select for facing shoulders, for disc grinding, or for internal grinding? Have you at hand any ready means of determining how to order wheels?
These and many other points are taken up thoroughly in the book; in fact it is a regular treatise on grinding wheels. It contains useful information for everyone, from owners to operators of machines.

Fill in the coupon and mail it.

Broken Tangs? Use "Perfect" Double Tang Sockets

What do you do with broken tang drills, otherwise in good shape? With the "Perfect" Double Tang Socket all you have to do is to grind a new tang on the shank below the old one, slip the drill into the socket, and you have practically a new drill—and all done in two to three minutes' time. The new tang is 25 to 60 per cent stronger.

Folder 19-C gives complete details.

The CLEVELAND Twist Drill Co.

New York CLEVELAND Chicago

HACK "STERLING" SAWS

COMPETITION COMPELS EFFICIENCY

Moral---When in need of Hack Saw Blades, buy the "Sterling."

MANUFACTURED BY

Diamond Saw & Stamping Works, Buffalo, N.Y., U.S.A.

On the Defensive!

There are times when the Foundryman is on the defensive.

It is when the tiger of competition is too self-assertive.

In the reduction of costs a new profit is created.

Stevens' Pure Plumbago reduces cost

One New York Foundryman writes:—

"Your Lead gives me the best peeled castings I have had for a long time, and the color is right, too."

That means that this Lead does the work expected in the Foundry instead of leaving it for the scratch-room or the chipping room to finish.

That means labor saving and cost saving.

Each shipment has its return ticket—it may be returned and freight paid by me both ways when not satisfactory.

The entire risk is on me!

Its use squelches all tiger danger.

I manufacture the entire line of **Foundry Facings and Foundry Supplies**, and the quality stamp impresses them all.

FREDERIC B. STEVENS

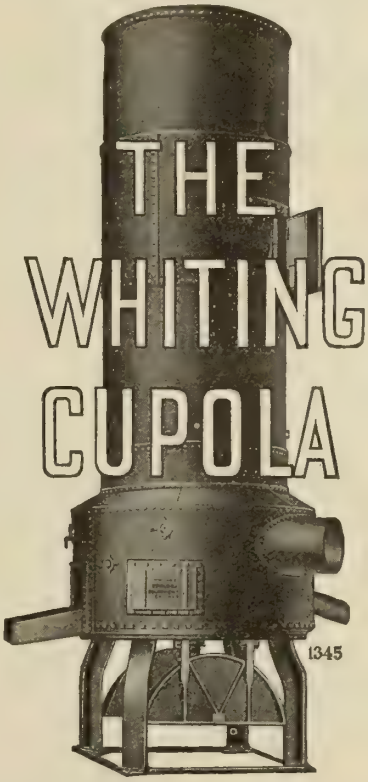
CRANES

All Types---For Every Service

Complete Foundry Plants

We make a specialty of complete foundry plants for any class of castings — grey iron brass, car wheel, pipe, steel (O. H. and converter), or malleable. We prepare layouts showing location of all machinery, furnish and install equipment, and conduct initial operation, relieving the customer of all risk. Send for our complete catalogue. Information gladly furnished.



Cupolas	Core Oven Cars	Furnaces (Brass, Malleable & O. H.)	Tramrail systems
Tumblers	Elevators		Turntables
Trucks	Air Hoists	Annealing Ovens	Sand Sifters.
Ladles, Core Ovens	Converters

Dixon Crucibles
EVERY crucible made by DIXON since 1827 has been made with the one idea of giving reliable service.
¶ In doing this nothing has been so helpful as our experience and our study of actual foundry conditions. ¶ In the purchase of raw material, in mixing it correctly, in spinning up the crucible, wherever there has been any question our experience has been called upon to give the final answer.
¶ Write for our booklet No. 223-A on the care and use of crucibles.
Joseph Dixon Crucible Company
Jersey City, N. J.

Which Journal do you use when in the market for Shop Equipment or Supplies?

THIS Directory is run every month at considerable expense for the benefit of our readers—*your* benefit.

¶ You will find listed practically every machine shop or foundry requirement, from twist drills to coach wheel lathes, and from foundry facings to cupolas.

¶ You will find under each heading from one to a dozen names of reliable firms anxious to furnish information for the asking.

¶ Turn from this directory to our advertising pages and study carefully what our advertisers say regarding their product.

¶ You do not derive half the possible benefit from any one issue of Canadian Machinery unless you study the advertising pages.

¶ The most progressive firms *believe* in advertising, and these are the firms who are constantly employing the best designers in order to keep their product thoroughly up-to-date.

¶ In his space, the man who is spending his life perfecting his product, tells you briefly about a few of the outstanding features. It is your privilege to write and get *complete* information, and that information is going to help you get better results.

Refer to Canadian Machinery Directory and Advertising pages---you will help us, the advertisers and yourself.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

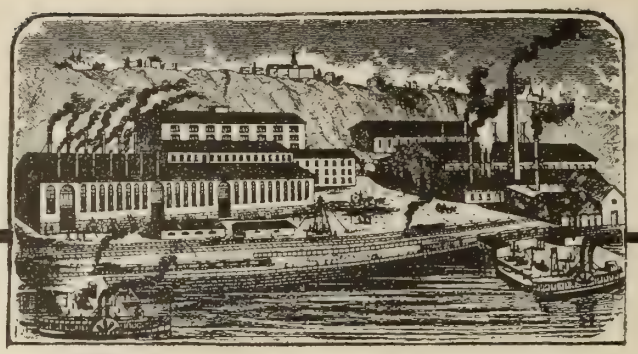
MARINE ENGINES and PUMPS. SHOE MACHINERY A Specialty



BRASS and IRON CASTINGS. BOILERS and REPAIRS.

That we have exceptional facilities at our disposal for the manufacture of all kinds of Machinery —in addition to our business as Brass and Iron Founders, General Contractors and Shoe Machinery Engineers—has been amply proved this year. In the short space of five months, we built and installed all the Engines and Boilers of the new sister steamers "Levis" and "Lauzon," whose trial trips were a complete success. We make a specialty of all kinds of Marine Engine Work, and shall be glad to quote for first-rate products only.

SHOE MACHINERY. Manufacturers of "Non-Royalty" Machines, Metallic and Goodyear, "Fortuna" Skivers, and "Climax" Presses, Sand-papering, Lasting and Loose Studding Machines.

Wire of every description for Slugger and Standard Screw Machines.

The Canadian General & Shoe Machinery Company, Ltd.

ERNEST CARON, Managing Director

LEVIS, Quebec

All Sizes, 1-4 lb. to 30,000 lbs.

We make new process converter steel castings, annealed and unannealed.

We also make Chrome Manganese and Nickel Steel Castings.

CASTINGS

High Grade Steel

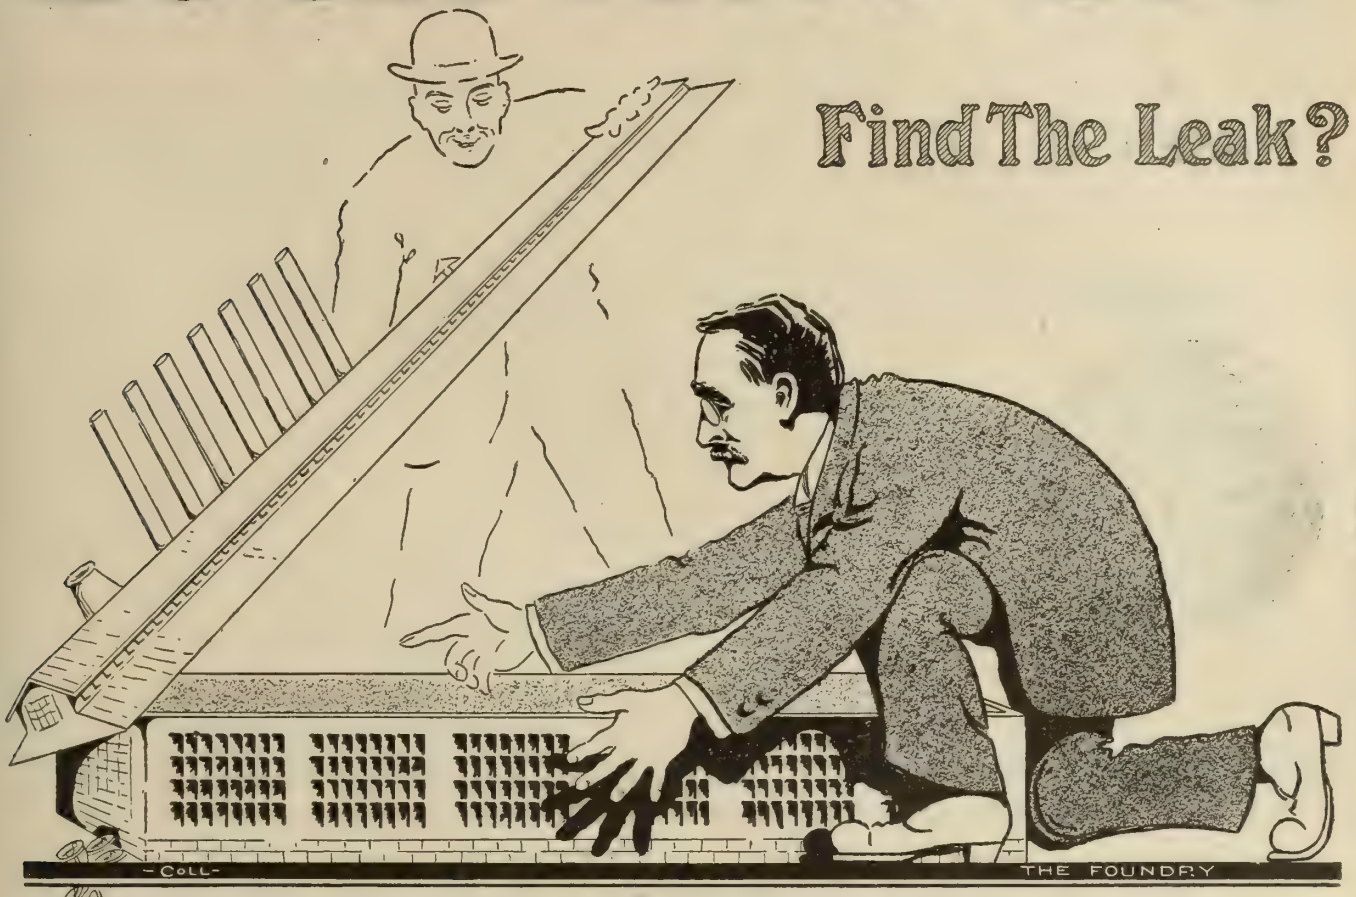
Joliette Steel & Iron Foundry, Limited

Head Office and Foundry—Joliette, P.Q.

Look Into It!



Examine Your Foundry Carefully

If you're not making the estimated profit on every order, there's a hole somewhere—SOMETHING'S WRONG—

GET BUSY AT ONCE!

It doesn't take a very big hole to let a dollar through, so don't ignore a little hole---remember a hole large enough to let ONE dollar through will allow thousands of dollars to slip through.

"Constant dripping wears away stones"---then locate that leak before the constant dripping of escaping dollars wears away the foundation stones of YOUR foundry.

INVESTIGATE SHELTON METALLIC FILLER

Shelton Metallic Filler is guaranteed to fill in and completely obliterate blow holes, sand holes, etc. It becomes part of the casting itself, is durable and can never be detected. It has been used with great success for many years.

Better write to us at once.

SHELTON METALLIC FILLER CO.
DERBY CONN.

SAND CASTINGS
IN
BRASS—BRONZE—ALUMINUM

The New Booklet, describing over twenty Alloys, is in press.
It is of value to Engineers and to all users of brass and bronze.

LUMEN BEARING COMPANY, TORONTO

DIE CASTINGS, in Babbitt Metals, Lumen and Special White Alloys, to an accuracy of 0".001

Write for the Booklets. They are INTERESTING.

The Engineer's Friend

To what base uses we may return:
Imperious Caesar dead and turned to clay.
May stop a hole to keep the wind away.
—Hamlet.

If SHAKESPEARE were alive and saw our advertisements he might exclaim "How appropriate is that quotation." But if he knew the good qualities of

HARRIS HEAVY PRESSURE

(THE BABBITT METAL WITHOUT A FAULT)
HE WOULD APPRECIATE THE USE MADE OF HIS IMMORTAL WRITINGS.

H. H. P. IS A HIGH GRADE BABBITT AT A MEDIUM PRICE.

Books for Foundrymen

Three good Books that should interest Foundrymen who wish to know more about their work.

PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price $1.00

FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price, ... $1.00

PATTERN MAKING. By G. H. Willard. To which are added chapters on Coremaking and Molding. 214 pp., 312 illustrations. Cloth binding Dealing with the practical experience of foundry work, tools required; woods adapted for the work; turning; and all kinds of patterns. Price, postpaid .. $1.00

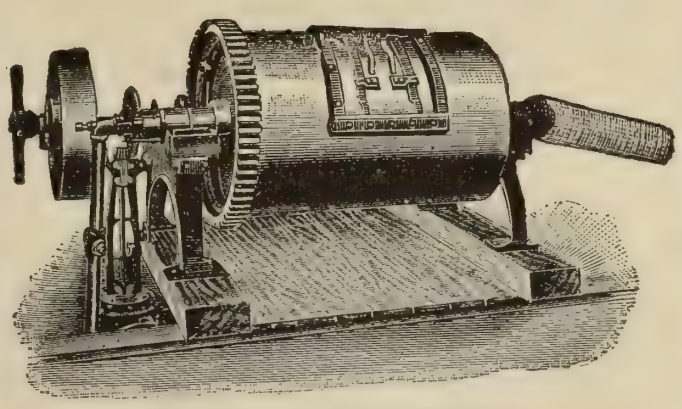
A GOLD MINE

SAVE YOUR IRON



SLY'S PATENT IRON CINDER MILL

Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the iron contained in your cupola dump and gangway scrapings and 75% of the coke. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

THE W. W. SLY MFG. CO., CLEVELAND, O.

The Daily Grind

The daily grind of mechanics engaged in using abrasive wheels is made much more effective if their machines are fitted with

CANADIAN HART CORUNDUM WHEELS

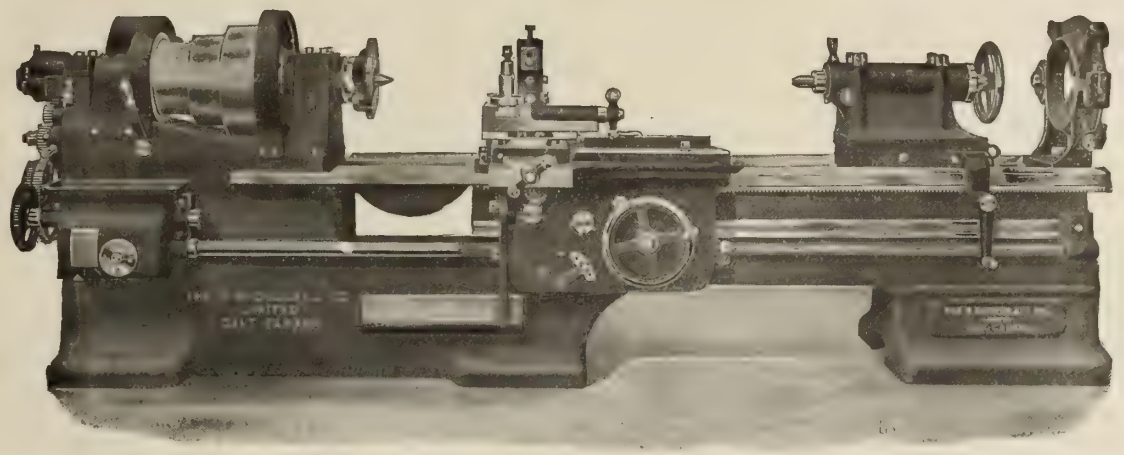
This is Ideal Lathe Equipment For Canada



THE pressing factory need for Canada is one of increased output---tools that can handle "peaks" in your order sheets that surge in on your factory, designed for meeting lesser output.

The lathe equipment is a point of congestion. Output has to be accurate, fine, finished to a hair; passed by micrometer guages and testing templets. Yet you may have to double your former speed of production on such parts.

The New McDougall quick-change Gap Lathe is the very best equipment you can install. It lengthens time of actual production. It cuts down "dead" time. It speeds the cut. It gives instant accuracy of cut.

Glance at the massive head-stock casting and the wide, solid base. This means a smooth-running, non-vibrating, even-powered tool. The wide, big bearings with automatic self-oiling, and the perfectly meshing wide steel gears with quick changes, place the McDougall far above ordinary deterioration.

But, more important than slow deterioration, is the McDougall capacity. There is reserve strength and reserve power. You can handle work with high-speed tools, without chattering, and by using water on the tool, can speed your cut 30% above normal, owing to the short shaft, solid bearings, and solidly borne tool support. Eighteen spindle speeds available.

Or this reserve strengh can be used to take a slow, deep cut, and remove more metal per minute.

This is efficiency. It means speeded production in your factory where the lathe equipment is the center of congestion. The McDougall Gap Lathe does this for you.

Note the top adjustment bolts on tailstock for quick change of lengths. This gives the McDougall Lathe the quick adaptability of a small tool. It means efficiency.

The compound rest reads to thousands both ways. The bed is supported and rigidly solid. The apron is wide and even in travel. The tool bearings are more than ample for solidity and steadiness. The temporary bridge over the supported gap gives every advantage of a standard bed lathe, and there is no "give" at the gap, though it is of larger diameter and generous width.

Write us regarding this equipment. We will install a single lathe or battery. You may have a range of gap and bed sizes to exactly meet your product. You have efficiency of production and quality of output absolutely insured by material and design. Write us,

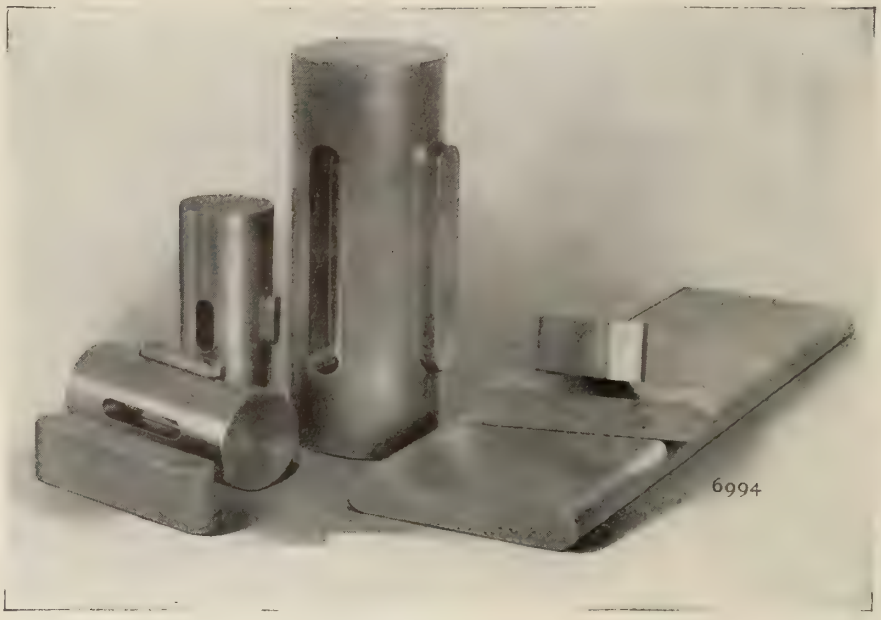
RECTANGULAR KEYS ARE NOW A COMMERCIAL SUCCESS



The heretofore excessive cost of milling, the keyways has been eliminated by the development of the

P. & W. Spline Milling Machine

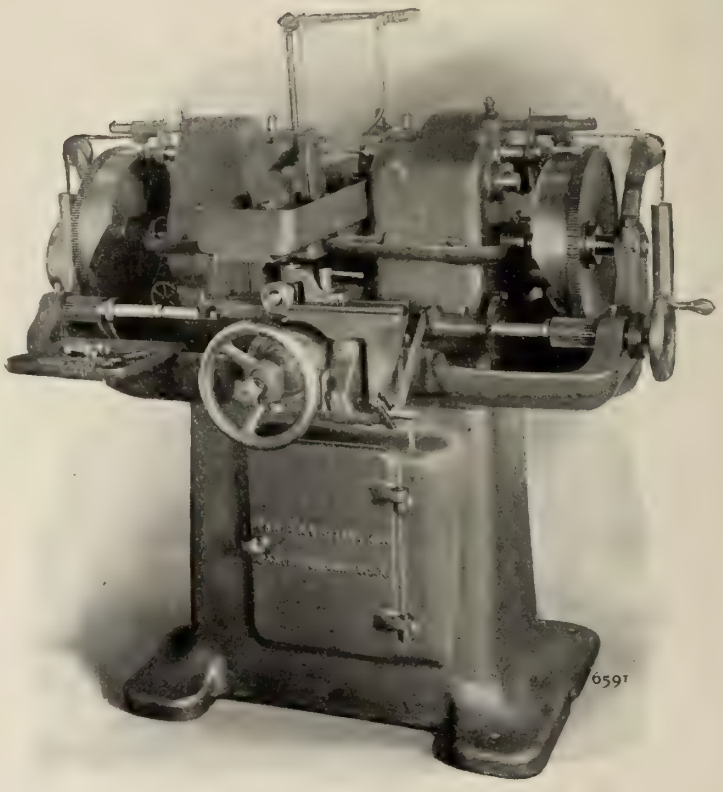
which rapidly mills the keyways in one simple operation, with the result that this system of keying is as cheap as any other.

Rectangular Keys by far the most Efficient and Economical.

1. They do not materially weaken the shaft. 2. They will not work loose. 3. Their shearing strength is practically equal to a solid member. 4. Two keys may be placed opposite each other on the shaft.

Cost of Cutting Keyways Greatly Reduced

For keyways and slots the Spline Milling Machine has proven the greatest labor-saving machine that has ever been produced. The metal is removed very rapidly and an accurate keyway or slot is cut in a remarkably short time. Automatic feature enables one operator to take care of from six to eight machines in some instances.



Write for descriptive circular "Spline Milling Machine."

The
"BEMIS & CALL"
Adjustable "S"
Nut Wrench

TRADE B&C MARK

An extremely useful tool for working in confined corners — places where a monkey wrench cannot be used. Its firm grip has made it famous, as it leaves the nut in perfect condition.

All parts are strong and durable. The operating nut is steel, and the sliding jaw a steel drop forging. All parts are interchangeable, and are carefully hardened and tempered.

We also make an adjustable "S" WRENCH which cannot be excelled for pipe work.

Write for our complete descriptive catalogue on Wrenches.

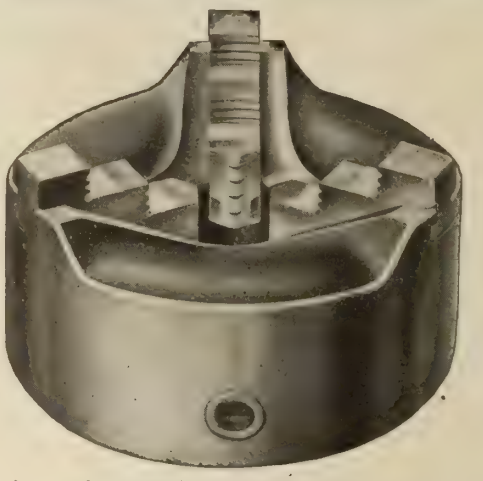
COLUMBIA HIGH SPEED CHUCKS

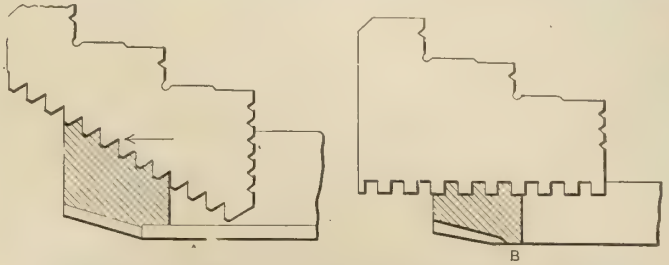
are especially adapted for work with High Speed Steel.



COLUMBIA UNIVERSAL CHUCKS

are the Chucks for High Power Machine Tools.

We claim that the Columbia Chuck is the best Universal Chuck that has ever been offered to the world. Also that in view of its power to "stand up" under the most strenuous service and its altogether unique lasting qualities, it is the lowest priced tool of its kind in existence. The work gripped in a Columbia will not slip and permits the use of high speed steel to its full cutting capacity.



Comparison of Pitch of Columbia with ordinary chuck.

Note the pitch of the scroll thread, it is much finer than the ordinary universal chuck, thereby increasing its gripping power and wearing surface.

Ask us for illustrated circular with full description.

Engine Lathes **CINCINNATI, OHIO, U.S.A.**

One Machine That Replaces Two Others and Does the Work of Either in Less Time

On all Face Plate Work Within Its Range

On all work within its range, the Vertical Turret Lathe replaces both the Vertical Boring and Turning Mill and the Horizontal Turning Lathe. It **combines** their good features. Thus it takes the place of either one of them with all the valuable features of the other **added.** But in combining the two, other features were developed which are exclusively the Vertical Turret Lathe's. Like a boring mill, it is heavy and rigid, capable of doing heavy cutting. Like the horizontal turret lathe, its turret provides a means of holding tools in instant readiness for a sequence of operations.

Unlike either of them, it has a Side Head for more tools, which can be brought into use simultaneously with those in the Main Head—Multi-cutting.

Unlike the horizontal machine, there is no overhang of the work—the alignment of table spindle is self preserved.

Unlike the boring mill, the **control is centralized**—time-wasting steps are eliminated. The similarities show that the Vertical Turret Lathe does all the work within its range, as well as **both** these machines.

Let us send you our interesting Treatise on Face Plate Work C-15—Free. It has the details.

Wanderer Milling Machines

are unsurpassed for modern design—first-class material—accuracy and output; over three thousand in use; they are built with single pulley drive and cone drive.

WANDERER WORKS

Formerly Winklhofer & Jaenicke, Ltd. SCHOENAU NEAR CHEMNITZ, GERMANY

The advertiser would like to know where you saw his advertisement—tell him.

We Maintain a Service Department.
YOU MAY USE IT

The production of a Milling Machine, perhaps more than that of any other machine tool is dependent upon proper equipment. And an intelligent analysis of the work eliminates more unnecessary movements, saves operator's effort, and makes greater savings in time.

The fixtures must be designed to take the maximum cut the work will stand. They must have plenty of room for chips and oil. They must be handy, so that the operator's time is conserved.

The cutters should be selected for the particular operation. There is no one cutter suitable for everything.

And **the proper Machine must be used.** We don't mean merely that the machine must be correctly designed and accurately made, but that it must also be the right size and **the right type** for the work to be done.

WE MAKE AND USE ALL KINDS OF COLUMN AND KNEE TYPE MACHINES—VERTICAL—PLAIN—UNIVERSAL—HIGH POWER SINGLE PULLEY DRIVE AND CONE DRIVE;—AND THEREFORE CAN RECOMMEND WHICHEVER IS THE BEST ADAPTED AND THE MOST ECONOMICAL FOR YOUR WORK.

You can help us to help you by sending us Blue Prints, Sketches or Samples. Tell us in what quantities the parts are made, the material used and finish required.

We will analyze each operation, make time studies, suggest fixtures and equipment, all complete and ready for use in your shop, and tell you what it will cost.

We will take the chance of demonstrating a saving.

Our advice costs you nothing. We are interested in the development of Millers.
We are helping some of the largest shops in the world.
May we help you?

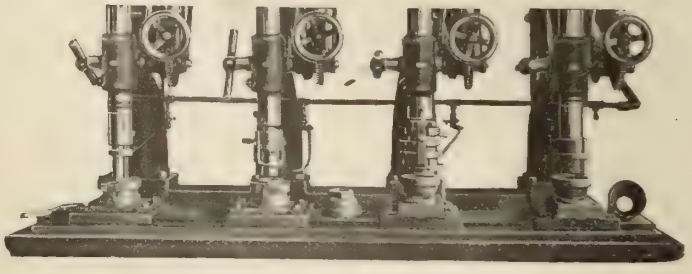
Rockford Drilling Machines



Keep Your Employees Busy

You are losing money if they are hanging on to levers or waiting for the power feed to run through the cut.

Rockford Gang Drills use the operators' time to the greatest advantage.

By proper Jigging and Tooling, and gauging the number of spindles per operator, a Gang Drill can be made one of the most valuable machines in the shop.

Rockford Gang Drills are simple and very strong.
They have served many years in some of the largest machinery plants on the continent.

Our booklet, "Jigging & Tooling," is free. It gives you the fullest particulars—it tells how you can increase your output at a minimum labor cost.

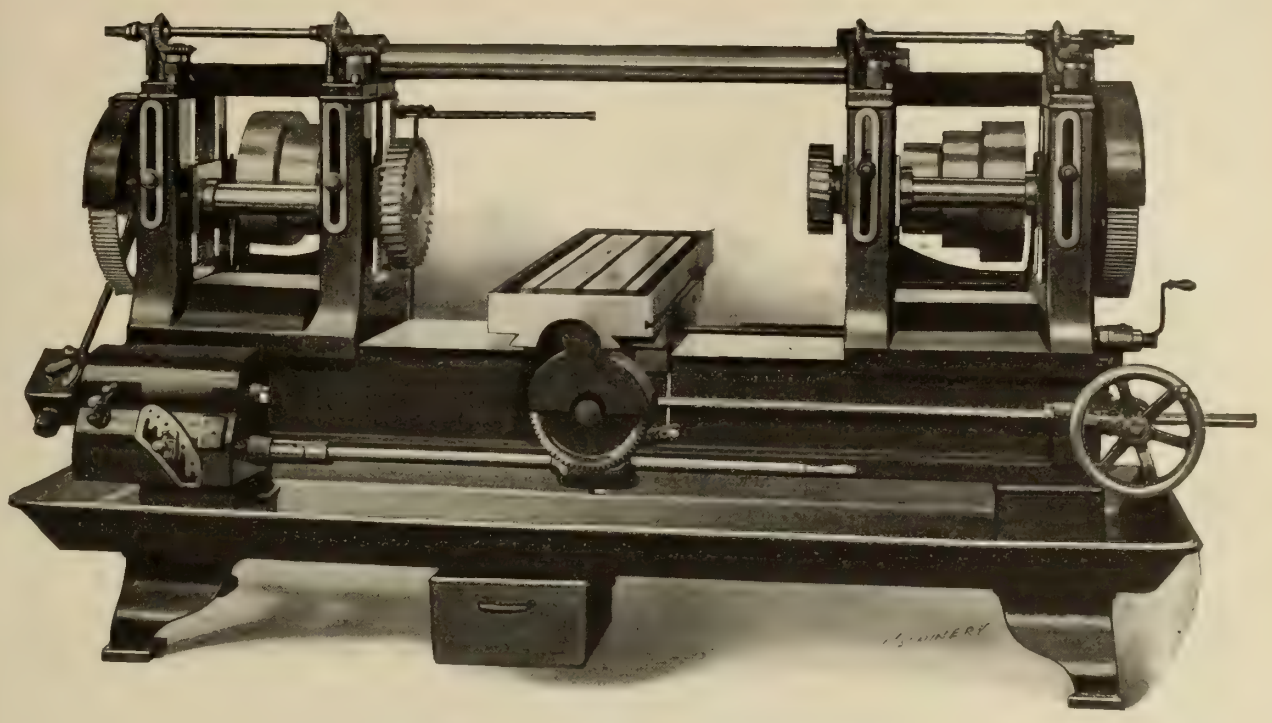
HEAVY PATTERN DOUBLE SPINDLE LINCOLN TYPE MILLING MACHINE



This machine is offered for the economical machining of castings or forged work on which two or more cutters can be used to advantage and with a material saving in production per piece. The main spindle bearing is 5¾ in. long, 4⅛ in. to 3⅜ in. taper diameter, and has Brown & Sharpe No. 12 taper hole. Nose of spindle 3½ in. diameter, threaded 3½ per inch and has driving slot for arbor.

We manufacture these machines in different lengths of bed and with different widths and lengths of table, so as to accommodate a large variety of work. The machine is fully capable of running high speed steel cutters.

"Detroit" Twist Drills

Trade Mark

"A Merry Christmas, Gentlemen,
God Bless you everyone."

It Happened in Detroit

Not long ago a well known Shop Superintendent sent for some "Detroit" Drills **on trial.** He set them to work on a tough job. In a very short time he realized that they were doing more and better work than the drills he had always used before.

Then he became suspicious; he began to wonder whether there was a drill that would do even better work than "Detroit" Drills. Experiments were in order. He sent for three other well-known makes and began a series of tests.

The Result—Three "Detroit" Drills running through cast iron at a speed of 1,000 r.p.m. bored, without grinding, 8 inches more metal than their nearest competitor.

"Detroit" Twist Drills

are now specified exclusively in that shop, and the Superintendent is no longer suspicious—he's satisfied.

It's about time to order your 1913 supplies. Why not make a test in your own plant? It won't cost you a cent unless you too are satisfied, for all "Detroit" Drills are sold under a rigid guarantee.

"Detroit" Twist Drills and other small tools are carried by dealers everywhere. Send for illustrated Catalogue "R."

Get some "On Suspicion."

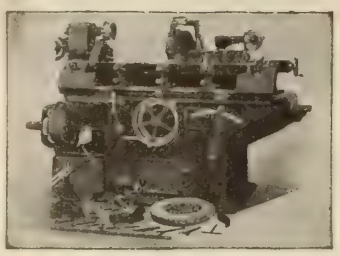
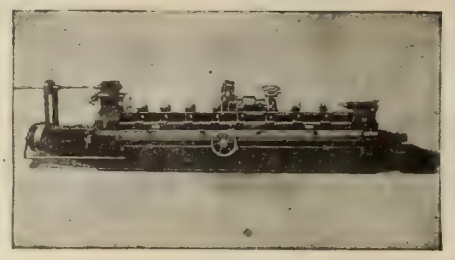
LANDIS PRECISION GRINDING MACHINES



Landis Plain Grinding Machines.

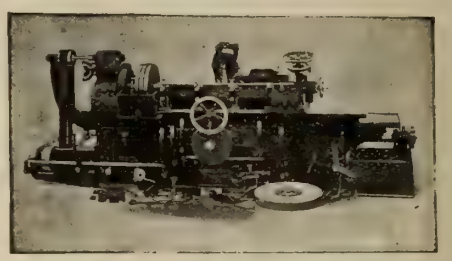
10" x 30", 12 x 32", 12" x 42", 12" x 66", 12" x 96", 12" x 120", 16" x 72", 20" x 96", 20" x 120", 20" x 144", 20" x 168". These machines are intended for finishing straight and taper spindles, shafts, rolls, tubing and all other work within their range which can be revolved on dead centres.



Large Type.

Standard sizes: 20" x 96", 20" x 120", 20" x 144", 20" x 168".

These manufacturing machines are adapted for straight and taper cylindrical shafts, spindles, pistons, corliss valves, plungers, tubing, and are especially desirable for grinding hardened steel and iron rolls.



Plain Grinding Machine with Gap.

These are our 16" Plain Machines built with gap in the bed to suit the location of the projection on the work.

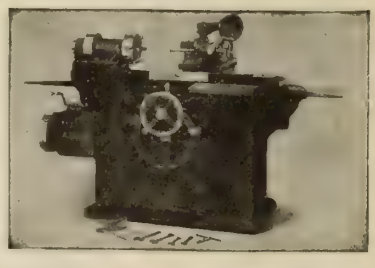
Largest exclusive manufacturers of grinding machines in the world.

Landis Universal Machines (Large Type).

No. 1 (10" x 20"), No. 1½ (10" x 30"), No. 2 (12" x 32"), No. 3 (12" x 42"), No. 4 (12" x 66").

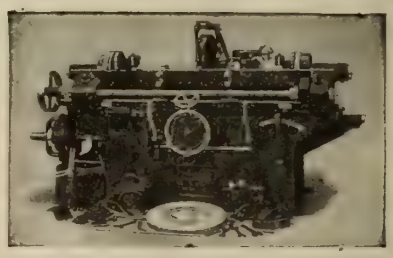
Nos. 2, 3, 4 (also built with 16" swing) are used for finishing tools and a variety of straight or taper parts (both external and internal) as are common to the toolroom, machine shop, railroad shop, etc.

Attachments such as magnetic chuck, gear cutter attachments, cam grinding attachment, side mill grinding attachment, etc., can be used on these machines.



Landis Internal Grinding Machines.

This machine is intended for straight and taper internal grinding. The fixtures for these machines will grind holes ¼" diameter or larger, and up to 12" long.



Landis Crank Grinding Machines.

These machines are designed for grinding single or multiple throw crank shafts used in gas and small steam engines.

The Webster & Perks Line of
Grinding and Polishing Machinery

Improved Wet Tool Grinder

A complete line of complete machines that will complete any plain grinding job with accuracy, economy and speed. In design, construction, capacity and durability, our grinding machines are second to none—they are built in a wide range of sizes and cover all branches of work, both light and heavy.

Our Improved Wet Tool Grinder is designed with a view of greater simplicity, and supplying the exact quantity of water desired without flooding. Water is admitted from reservoir to wheel pan through bronze valve operated by foot treadle, eliminating all weights, pumps, belts, etc., and troubles incident to same.

Our No. 2 Self-oiling Polishing and Buffings Lathe is designed for belting from above or below; in the latter case through the hollow base, preventing belts carrying dust, lint, etc. Has exceptionally long bearings (14¾ in. long each), insuring great strength, rigidity and longevity.

20 different sizes and styles of Grinding and Polishing Machinery in catalogue—may we send it?

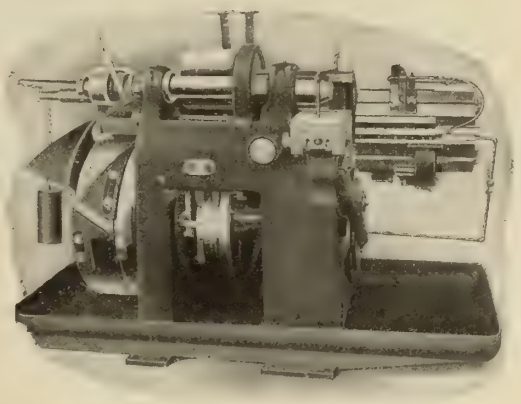
Ensure a Fast, Accurate, Economical Output By Using

The Gridley Automatic

Turret Lathe



"GRIDLEY" SINGLE SPINDLE

The "GRIDLEY" is the only automatic that gets away from the old box tools and uses extra tools on the slide.

The rigidity of the tools and general design of the machine permit heavier cuts and coarser feed to be maintained. The result is greater output.

A stiffer and more efficient tool can be used on the "GRIDLEY"—a tool which is held rigid, without overhang; a tool which cannot spring or wobble. This assures absolute accuracy. **Much time and labor can be saved by the use of the "GRIDLEY."**

One operator can attend to several machines at once, and can use tools tandem when necessary. We also manufacture the **"GRIDLEY" Multiple Spindle Automatic.**

Write for descriptive catalogue NOW.

"GRIDLEY" service is well worth investigating—do not hesitate.

Shapers and Milling Machines

We manufacture a full line of Shapers and Hand Milling Machines, 14, 16 and 20 in. Single Geared Crank Shapers, 16, 20 and 24 in. Back Geared Crank Shapers, 26 and 32 in. Triple Geared Rack Driven Shapers.

Our Hand Milling Machines are especially adapted for the manufacture of small parts rapidly and accurately. We manufacture this machine with lever and screw feed to table, and screw elevation for the knee, or with lever feed for both table and knee. These machines are especially adapted for keyseating shafts and will manufacture small parts quicker than can be done on a larger machine. We would like to send you circulars describing our Shapers and Milling Machines.

High Speed Steel Has a Solid Foundation In a Name That Means Something

Cutting speed attained on cast iron: Roughing cut, 140 ft. per minute—finishing cut, 210 ft. per minute.

In NOVO SUPERIOR you secure a materially increased speed over the high speed steels now in use, the highest quality, greatest toughness, longest life (3 times that of any other) and exceptional ability to cut very hard materials. The cutting edge retains its sharpness from 3 to 4 times longer than other high speed steels. Hardens in oil, air or water, and is now carried in stock in our warehouse in all current sizes, flat, squares and rounds; annealed and unannealed.

RAPID WORKERS

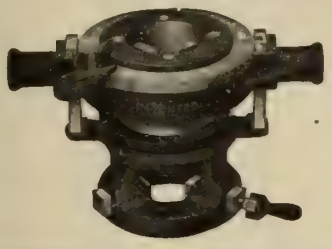
No Hunting for Parts

Hunting for parts is frequently the habit of those who use ordinary die stocks—it means the loss of much time and money. With the

"Beaver" Adjustable Die Stock

four sizes can be obtained with one set of dies, through a twist of the wrist.

You will save much time through the use of a "BEAVER." When your dies wear out you will have to buy one new set of dies instead of four.



The Beaver is absolutely accurate and has proven itself the most convenient.

Get our quotations on power machines, any size from ⅛-in. to 12-in., motor, belt, gasoline or steam driven.

An investigation will prove valuable to you. Write for circulars and prices.

Remove Stock Rapidly, Accurately and Smoothly

Half a century of manufacturing experience has made Nicholson-made Files recognized everywhere as the standard of File efficiency.

All users of files know that Nicholson-made Files save time because they Remove Stock Rapidly.

Among the 4,000 kinds of Nicholson-made Files, all workers of metal will find a file for their particular purpose.

Nicholson-made Brands manufactured in Canada are; **"AMERICAN," "ARCADE," "GREAT WESTERN," "GLOBE," "EAGLE," "McCLELLAN," "KEARNEY & FOOT," "J. B. SMITH.'**

Nicholson File Co., Port Hope, Ont.

Concerning Hack Saws

The best is recognized by its rapid cutting and lasting qualities. The best is recognized by the name

Starrett

Every Tooth Cuts;

Think how much more work this saw does than one having one tooth in ten doing the cutting.

Every Tooth Has the Right Shape:

The square cutting edges are at the angle which will cut quicker in the metal for which the blade is made.

Every Tooth Has the Right Set:

You save material because the set is only enough to clear freely. You save strength because you don't cut up a large amount of metal.

Before buying consult our Catalog No. 193—it's yours for the asking.

REDUCE METAL
WITHOUT WEAKENING IT

Our Book "The Modern Art of Swaging" sent free on request.

Swage The Dayton Way

The Dayton Swaging Machine does not sacrifice one particle of strength of the metal being reduced. From 2,000 to 6,000 taps per minute knead or squeeze all of the desirable quantities into the portion where its diameter is reduced. Thus the metal has added strength, solidity, rigidity, elasticity and uniformity. Swaging is far superior to rolling, grinding, milling, turning or drawing as a means of reduction of metal.

Send a sample of your work and we'll quote the saving by the "Layton" way.

Excelsior Needle Co.

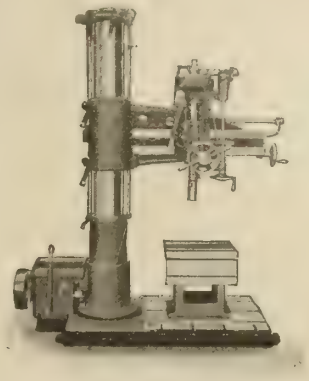
THE TAYLOR & FENN COMPANY

HARTFORD, CONN., U.S.A.

"The Mueller for Mine"

The Standard Type MUELLER is especially adapted for shops where the work requires a high-priced radial drill. We also build Simple Type Radial Drills for those whose work does not require our Standard Type Drill.



We wouldn't turn out a drill at any price if it wasn't good enough to be labeled "Mueller."

Mueller Radial Drill

is the only radial drill having a patented stationary column. This column is one of the most valuable features of our drill, because it prevents springing of the arm when the drill is under severe strain, eliminates all vibration, and enables you to do the heaviest class of work in the shortest possible time.

It is one whole piece, and reinforced by four internal webs extending from top to bottom, and is finished by grinding, making it very accurate.

Send for the Mueller Catalog.

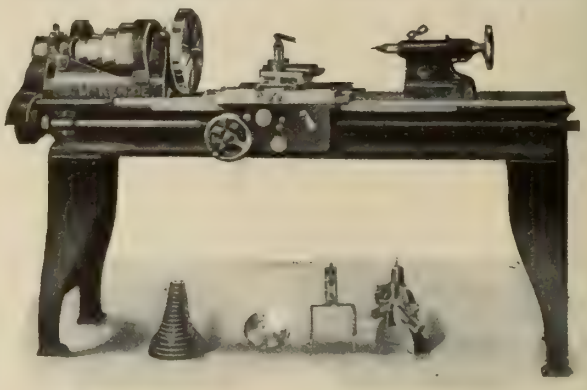
"McKenzie" ENGINE LATHE



POWERFUL—ACCURATE—EFFICIENT

Made in two sizes, 14 in. x 6 in., and 14 in. x 8 ft. bed, from new patterns of an improved design.
They are manufactured from materials selected after many years of careful experimenting—materials that are the best.
The SPINDLE is of high carbon hammered steel, and runs in bronze bearings, carefully hand scraped and finished.
The TAIL STOCK is of the cutaway type, allowing the compound rest to be set parallel with bed.
The COMPOUND rest is graduated in degrees, and both upper and lower screws have index collars.
This Lathe has all gear feeds. Three changes of feed can be had by means of a friction gear on end of screw.
Lathe furnished complete with counter shaft, plain or compound rest, centre rest, follow rest, large and small face plates, wrenches and complete set of change gears.

Write at once for catalogue and specifications.

A Quick and Effective Remedy for Defective Castings

Blow-holes, sand-holes, etc., in iron and steel castings can be speedily repaired by an application of J-M Ferro Compound. And the repairs will be permanent because this Compound metallizes in a few hours and becomes a part of the casting itself.

J-M Ferro Compound

can be finished with a fine file or an emery wheel when hard and cannot then be told from the iron itself, as it is the same color.

It is furnished in powdered form and mixed with water to the consistency of putty for application.

The advertiser would like to know where you saw his advertisement—tell him.

$35 per Minute-$2,100 per Hour

is a lot of money to pay for one hour of your spare time, but it is being paid—every month.

¶ And the most remarkable part of it is, the Money Is Being Paid To Tell You Something You Ought To Know!

¶ America's best Manufacturers of the lines of goods you purchase, pay $2,100 every month in order to bring before you, in "Canadian Machinery's" Advertising pages, information about their latest and most improved machinery and equipment.

¶ That information should be read by YOU every month. It is invaluable to every buyer, to every owner, business manager, superintendent, and to every machine shop man who is anxious to secure that which will give the greatest service.

¶ Be willing to listen to the story that the advertiser has to tell. The purpose of everything new these days is twofold—to save money and to give greater efficiency. Perhaps in this very issue of "Canadian Machinery" there is a veritable gold mine for you.

¶ Be open to conviction. Read the ads. Weigh them in your own mind. Say to yourself, "Will this machine save me money? Will that new device render my men more efficient? Can that special machinery maker construct my new machines? Would this file which the manufacturers think enough of to spend money to advertise, be cheaper in the long run than the files I have been buying?"

¶ If the men who are spending $2,100 this month to advertise in "Canadian Machinery" were to meet you personally you would listen to what they had to say. If they were to show you a new machine and tell you something interesting about it you would be disposed to examine it, and to examine your own needs to see whether you could profitably use it, wouldn't you? The advertiser is doing it by proxy.

¶ Advertising is the big man's substitute for a personal talk. It is timed for your convenience, for you can read in your leisure. The facts are hard and cold in the printed word. Advertising is paid for by intelligent men for intelligent men to read.

¶ Read the Ads.! Be they large or small they are full of meat. They are written and paid for by firms who are reliable, who are up-to-date, who are liberal, with liberality sticking out of their goods and their service. They are the firms it will pay you to do business with.

¶ Read the Ads.

A NEW WRINKLE IN PISTON PACKING

Shortsville, N.Y., July 10th, 1912.

Magnolia Metal Co.,
113-115 Bank St., New York, N.Y.

Gentlemen:—

Your letter received some time ago regarding my experience with Magnolia Metal would have been answered before, but I was giving your metal a new test.

I have used it on crank pins, main bearings, guides of engines, also bearings of motors and high speed fans, where other metals failed to hold. I had one 36 in. Fan that had to be rebabbitted nearly every day. After putting Magnolia in, it held over a year; held until the oiler neglected to keep plenty of oil in oilwell, which was no fault of the metal. It was on this Fan that I first learned of the value of Magnolia.

But the test I now wish to speak of is a Piston Packing, for which I found that Magnolia proved a great success on a 180 H.P. Engine at 90 R.P.M., carrying load of 250 I.H.P. I could not keep any packing in stuffing box on piston that would hold over three or four days, so concluded to try Magnolia. Here is my method: I take the metal, place it in a milling machine, mill up fine, then prepare cloth sacks, fill with fine metal, wrap them around the piston, screw up gland and put engine to work. Piston will blow back two or three days and then stop, and you will then have a perfect metallic Packing: I found that the pressure will drive metal together which will wear for years. I have found that this never fails on bad rods, where no packing will hold. I never tried this before on an overloaded Engine, but on Engines carrying the rate of power, but this engine that I have just treated is 180 H.P. Corliss, doing 250 I.H.P., and it has proved O.K., as it always has before.

You may use this letter if you wish, or I shall be pleased to aid anyone by my experience in using Magnolia, for I know its worth, as I have used it in some hard places and always found it true to wear without trouble where other metals failed.

I always keep Magnolia on hand and would not be without it.

Yours very truly,

F. N. TITUS, Engineer,
Shortsville Wheel Works, Shortsville, N.Y.

Don't be deceived!

The construction of the joint is a *Vital Factor* in the repair and maintenance costs of any silent chain.

THIS two-pin joint construction reduces repair and maintenance costs to a minimum, because it almost entirely eliminates joint friction.

The pins are so shaped and arranged in the joint that with each position occupied by the links on or between the sprockets, one pin has a definite relation to the other.

The entire joint friction is taken by one pin rolling or rocking against the broad flat surface of the other. It's exactly the same principle as the rockers of a chair rolling on the floor.

This "Rocker-Joint" is an exclusive feature of Morse Silent Chains. Used in all sizes ¼ to 3,000 h.p.

We have a force of experts whose duty is to work out transmission problems *for you.* Will you avail yourself of their services? A request at any time for information will receive prompt and courteous attention. When writing us, please ask for Bulletin 11.

Ball and Socket Adjustable Hanger

Ball and Socket Adjustable Hanger

The Most Economical Roadbed For Power

That steady, stealthy *loss* that besets so many factories—*excess bearing friction*—can be eliminated easily and at a very moderate cost by the use of ball and socket, self-lubricating hangers and bearings correctly designed and carefully made. It is a surer way than resorting to ball or roller bearings, or individual motors and is far less expensive in both first cost and upkeep.

Dodge bearings reduce friction because there is a true ball and socket connection between the bearing and the frame in hangers and pillow blocks, which permits the bearing to freely align with the shaft. That means equal pressure and reduced friction.

Alignment of shafting is a very important factor in eliminating excess friction and perfect alignment can only be obtained by adjustments which preserve the necessary ball and socket connection. This is accomplished in Dodge hangers by means of a *four-way adjustment.* Vertically by large diameter threaded cast iron plunger screws, machined on the ends to fit the ball on the bearings, and horizontally through slotted holes in the base of the frame. This is the only proper method of four-way adjustment.

In a true ball and socket hanger, with self-lubricating bearings having a perfect and continuous circulation of lubricant, the shaft runs on a film of oil and does not touch the metal lining of the bearing. That is the kind of hanger the Dodge is. For day in and day out, year after year service it is the most nearly "anti-friction," and the most economical shafting bearing on the market to-day.

Dodge hangers and pillow blocks are furnished with ring or capillary self-oiling bearings, all lined with a high grade metal, and *bored* and *reamed.* One filling of oil will last three to six months. They are carried in stock at Dodge branches and by leading machinery and supply dealers in all parts of the country. When buying hangers, pillow blocks, or any shafting bearings, specify Dodge. They will make the best roadbed for *your* power.

Send for latest catalogue.

Buffalo Electric Steel Pressure Blower for cupola service.

Belt troubles eliminated with the

"Buffalo" Direct-Connected Foundry Blowers

The centrifugal fan is one of the most ideal pieces of machinery made, in that it has **no other wearing parts than the bearings.** When properly constructed, it will outlast any positive blower three or four times, and unlike the latter, **maintain its original efficiency to the last minute.**

You can now obtain any Buffalo centrifugal fan, blower or exhauster, **direct-connected to motor, engine or turbine.**

We have made a specialty of developing distinct direct-connected types for

Cupola Service,
Heating Furnaces,
Removal of Smoke and Fumes from foundry.

Exhausting dust, shavings and refuse of any kind from tumbling barrels, sand blast machines, emery and buffing wheels, wood-working machinery, etc., operating with the lowest power consumption, each in its particular service.

We will put these outfits alongside of any positive blower or belt driven centrifugal fan, **and prove that in the long run and at varying loads, their power consumption will average up the same and even less.** In addition you save the entire cost of belting, interruptions and attendance.

Let our engineers advise you definitely what we can guarantee in YOUR case. There will be no obligation.

No. 3A Universal Milling Machine

The Constant Speed Drive Enables You to Pull Heavy Cuts

The constant speed drive type of milling machine was originated at the shops of the Brown & Sharpe Mfg. Co., and placed upon the market by them. The fundamental principle of this type of machine is a single pulley or motor running at a constant speed, from which develop features that are distinctly advantageous in modern milling machine practice.

Brown and Sharpe

on a Milling Machine is just as much of a guarantee to you as the name "Sterling" on silver. You can depend upon a B. & S. Machine to accomplish what is claimed for it. A glance at the above illustration will show the lines and proportions of the machine as a whole, the heavy and massive frame, the large and rigid base, the vertical depth of table, saddle and knee, the rigid arm brace and arbor support, and the accessibility of all hand wheels and levers for controlling the various movements.

Any standard constant speed motor can be employed on this machine. The drive is direct from the countershaft to the machine driving pulley, which is of large diameter and runs at a constant speed.

Capacity of this machine is, longitudinal feed, 30 in.; transverse feed, 10 in.; vertical feed, 19 in.; all feeds automatic.

Write to our nearest branch for special circular containing full description and specifications of the B. & S. No. 3 Universal Milling Machine.

New Foundry at the Waterous Engine Works, Brantford

By J. H. Williams.*

It is just sixty-eight years since the foundation of what is now one of the leading firms of engineers and boilermakers in Canada was laid. The Waterous Engine Works Company at that time established themselves in a small way at Brantford, Ont., where they have remained ever since, gradually extending their plant and the scope of their operations until now their products are to be met with from one end of the Dominion to the other.

IN ITS early days the Waterous Engine Works Company, Ltd., manufactured principally stoves and plows. These soon gave way to threshing machines and sawmills, to which were added, as time went on, boilers, steam engines, fire engines, heavy fire apparatus, brick machinery, wood pulp machinery, etc., etc. From its earliest inception, the business went briskly ahead. New buildings and equipment were added from time to time until more than half a city block was occupied by the plant, and still the business demanded extension. Being hemmed in on all sides, unable to extend further on their old site and feeling the handicap of being without railway sidings to their plant, the company finally had to face the question of rebuilding on larger premises either in Brantford or elsewhere.

The city, not wishing to lose a concern of this size, expressed its willingness to take the old site off the firm's hands and they were thus free to remove to their present location on South Market street, where plenty of room for extension and good railway connections were available. On the new site the large plant which they now occupy was erected in the year 1895. It covers an area of some twenty-five acres and gives employment to about 400 men.

Associate Editor, Toronto.

Recent Additions.

Since 1895 several additions have had to be made. The machine and boiler shops have been extended from time to time, until the old foundry was eventually found to be inadequate for turning out the tonnage of castings, necessary to keep the machine shop, etc., fully occupied. As a consequence, it was decided to build a new and up-to-date foundry having a greatly increased capacity.

The New Foundry.

The cost of handling raw and finished material being always a large item of expense, the new foundry has been designed with special reference to inter-departmental transportation facilities, and equipment has been installed that permits of the handling of all material in the most economical manner. The new building is on the north side of the plant and runs parallel with the machine shop, the old foundry being at right angles and connecting the two departments. This old foundry is now being converted into a cleaning room, finished store room and pattern shop. In this way the rough castings will pass by consecutive stages and by the shortest possible route from molding floor to machine shop.

The new foundry, as may be seen from the illustrations presents a very light and airy appearance. It is 240 feet long by 110 feet wide with an extension, measuring 68 feet by 30 feet in the north-west corner, for the core ovens. The centre bay is 50 feet wide and there are two side bays 30 feet in width, that on the north side having a gallery overhead which accommodates the sand and coke storage bins, brass foundry, etc.

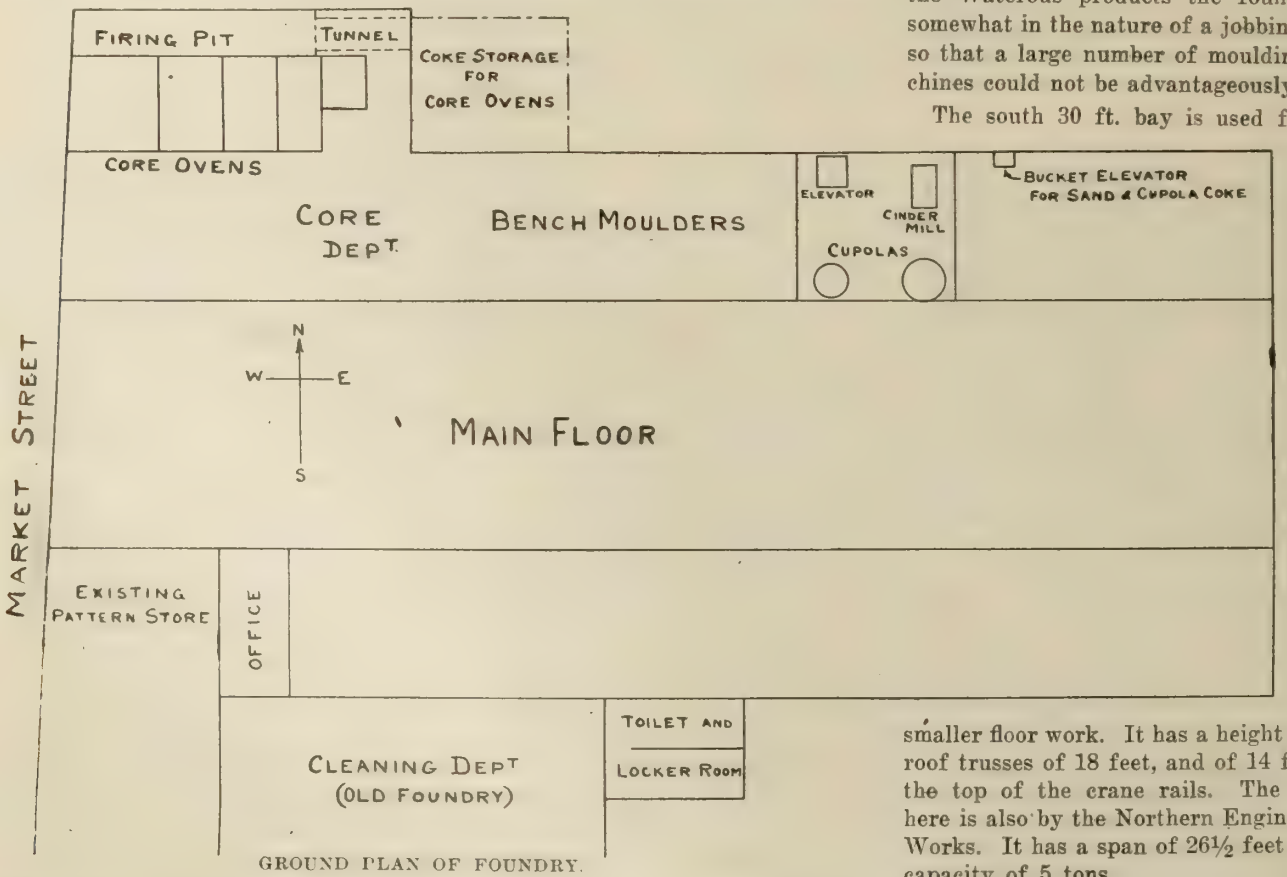
The structure is fire-proof throughout, with self-supporting steel frames and brick curtain walls. Particular care has been taken in the design of the build-

MAIN BAY OF FOUNDRY—LOOKING WEST.
A second cupola is now being installed. Note the arrangement of radiators on the columns.

ing to permit an abundance of natural light. A large proportion of the roof is glazed, and the windows occupy some 50 per cent. of the wall space.

INTERIOR OF THE OLD FOUNDRY.
This is now being converted into an up-to-date cleaning and storage department.

The foundry, with the exception of the cleaning department, is self contained, the molding, core making departments and core ovens being all under one roof. The main (50 ft.) bay is used for floor molding and the production of the heavier castings. The head room to the bottom chord of the roof truss is 30 ft., 9 in., the crane rails being 7 ft. 6 in. lower. This bay is served by a 15-ton electric traveling crane of the 3 motor type built by the Northern Engineering Works, Detroit, Mich. In addition to serving the full length of the main bay, this crane, by means of a 120 ft. extension, operates outside the building and handles the heavy iron flasks, etc., which are stored in the yard. The crane passes in and out of the building by special steel doors which are electrically operated. These of course are kept permanently open in summer.



GROUND PLAN OF FOUNDRY.

In addition to the 15-ton traveler the main floor is also served by jib cranes. Their arrangement is new and distinctly interesting. These jib cranes are not located permanently in one position, but can be readily transferred from one column to another. Each column is fitted with sockets strong enough to support the crane at its maximum load, and when any jib has finished its work at any particular column it is lifted from its sockets by the overhead traveler, and carried to another part of the shop. Thus, the capital cost of the jib cranes has been kept low and yet the service secured is practically equivalent to having a crane at every column.

The floor of the main bay, for a space 80 ft x 50 ft., is covered with a system of pits and grids for bolting down large flasks. The bars are spaced 4 feet apart and are 6 feet below floor level. Near the upper end of the bay there is a Mumford 10-inch jolt rammer, which is used both for moulds and also for large cores. Further mechanical moulding equipment includes two Pridmore roll-over draw-pattern machines, one of which takes a 56-in. x 24-in. flask and the other a 24 in. by 24 in. flask. There is also a pulley moulding machine which will turn out any size of pulley from 12 in. to 18 in. diameter. Owing to the varied nature of the Waterous products the foundry is somewhat in the nature of a jobbing shop so that a large number of moulding machines could not be advantageously used.

The south 30 ft. bay is used for the smaller floor work. It has a height to the roof trusses of 18 feet, and of 14 feet to the top of the crane rails. The crane here is also by the Northern Engineering Works. It has a span of 26½ feet and a capacity of 5 tons.

The Core Room, Core Ovens, Etc.

The north 30 ft. bay accommodates the core makers, bench molders, cupola room,

etc. The east end of this bay for a distance of 64 ft. is used for small floor work and is served by a 5-ton traveller. Next to this comes the cupola room to be

VIEW OF FOUNDRY FROM GALLERY—LOOKING EAST.

referred to later. Its location may be seen on the plan—page 356.

The space between the cupola room and the core ovens is occupied by the bench moulders and core makers. Both departments have been allotted ample space and have an abundance of natural light. Heavy cores are rammed on the Mumford jolt rammer previously mentioned, and cylindrical cores from 3-8 in. up to 6 in. diameter are made by a Wadsworth core machine driven by a small motor attached to an adjacent column.

The core room has a concrete floor and is served by a 5-ton electric traveler which runs from the core ovens to the cupola room.

There are five core ovens, four being at right angles to the main bay and one small oven at right angles to the others. This small oven is 12 ft. x 10 ft. and is equipped with a small truck and has also a revolving shelf for drying small cores. The four larger ovens are all 20 feet long and vary from 8 ft. to 16 ft. in width. They are all equipped with steel roller doors, and can be fitted with shelves when necessary. For this purpose, cast iron blocks are built into the walls at intervals. These blocks are flush with the brickwork, and each has a hole into which a piece of wrought iron pipe can be inserted to form a support for a shelf. In each oven, the flue opening for the incoming heat is in the floor near the door, while the smoke outlet is at the opposite corner high up in the back wall; thus, a good circulation of heat is assured. The ovens are all fired by coke from a common pit on the north side. The coke is dumped from cars into a pit just outside the core oven annex, and is brought in to the firing pit in wheelbarrows through a short tunnel. Finished cores are stored on top of the core ovens where is located the motor-driven cutting and coning machine.

The Gallery.

The gallery extends the full length of the north bay and is 20 feet above main floor level. It has a floor of reinforced concrete, 6 inches thick, supported on 15-inch I-beams, which rest on 33-inch steel girders carried by the shop columns. On the gallery are located the sand and coke storage bins, sand tempering machinery, cupola charging floor, and brass foundry.

The arrangements for automatically handling the sand and coke are very complete. These materials come in on a track parallel to the foundry, and are dumped into a pit below the track, whence they are carried by a bucket elevator to a smaller receiver above the gallery. This receiver is fitted with two chutes, one of which delivers to a large coke storage bin beside the cupolas, and the other to a 12-inch rubber belt conveyor which carries sand to a series of storage bins at the west end of the gallery.

The sand mixing machine is conveniently, situated near the bins and delivers the tempered sand to a small cone-shaped truck fitted with a bottom sliding door. The gallery floor is provided with a number of vertical chutes connecting with the main floor downstairs, so that when the above mentioned sand truck is rolled over the orifice of one of these chutes, the bottom sliding door is withdrawn and the sand falls through. The elevating and conveying machinery was built by the Waterous Engine Works Co. themselves, and is electrically operated, as is all the equipment throughout the foundry, except, of course, the pneumatic moulding machines, etc.

Pig iron and limestone are stored in the foundry yard and are brought up to the gallery floor, which, of course, forms the charging platform, by a platform elevator. The latter is raised by a motor-driven drum and is of the usual type. From there, the pig, etc., passes to a Fairbanks multiple beam platform scale on its way to the cupola.

The cupola room measures 32 ft. x 30 ft. It will eventually house two cupolas, though the second is not yet in place. The one already installed is a 72-inch

A CORNER OF THE BRASS FOUNDRY.

Colliau, while the one about to be transferred from the old foundry is a 60-inch cupola made by the Waterous Engine Works Co. Blast is provided by a motor-driven Sirocco fan built by the American Blower Co.

The brass foundry occupies a space of 32x30 ft. at the east end of the gallery, and keeps four men steadily employed. A small jib crane in the middle of the shop serves the whole floor. There are two pit furnaces and a Kroeschell-Schwartz gyrating flame tilting furnace of 500 lbs. capacity. Natural gas is the fuel used. Brass castings up to 1,000 lbs. in weight are made, and also aluminum castings when required.

General Remarks.

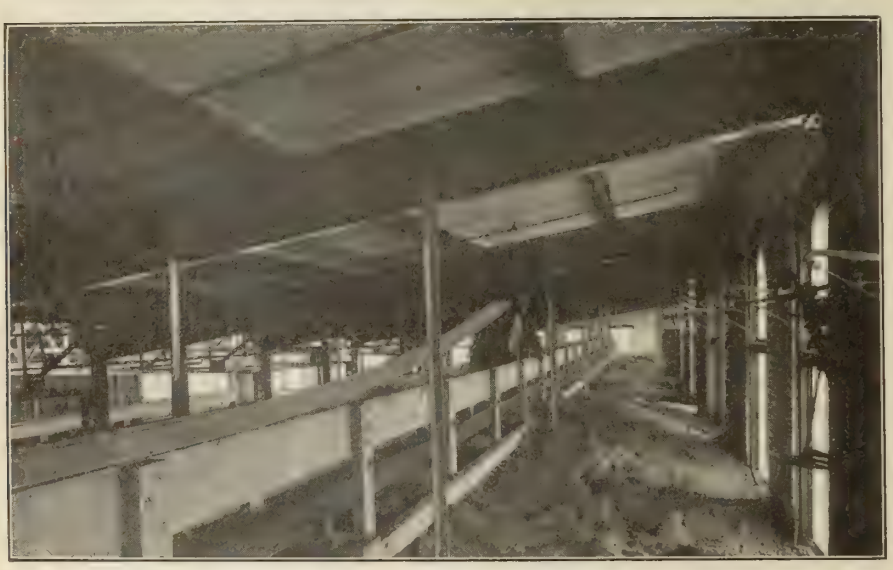
In addition to having excellent natural lighting, the ventilation is exceptionally good. As may be seen in the illustration on page 357, there are continuous ventilating doors on each side of the monitor roof over the main bay. These doors can be operated in sections of twelve from floor level by screws and rods fitted with universal joints. These doors are found to provide ideal ventilation. Artificial lighting is by flaming arc and tungsten lamps, the current for these and for driving the various motors throughout the plant being generated by the company in their own power house.

The foundry is heated by exhaust steam, the radiators being arranged below the windows and on many of the shop columns. In the latter case, the radiators sit snugly in the channel of the column and are flush with the flanges. This is clearly seen in the illustration on page 355. Fire protection is afforded by an efficient sprinkler system.

To render their identification the more easy the various pipe lines are painted distinctive colors. Thus the natural gas pipes are red; water pipes, white; and compressed air pipes, green.

Large crane ladles are dried by a coal fire in the usual way, but hand and bull ladles are dried out by natural gas. The output of the foundry is about 100 tons weekly, but the shop is not yet working at its full capacity owing to want of adequate cleaning facilities. However, the old foundry will soon be transformed into a thoroughly up-to-date cleaning room, fitted with square type exhaust tumblers, sand blast apparatus, and all necessary equipment. The south 80 ft. of the building will have an upper floor which will form a pattern shop.

The new extensions will practically double the foundry output of the Waterous Company; thus, not only enabling them to turn out their work in a more expeditious and economical manner, but at the same time allowing of a further extension in all other departments.



CONVEYOR BELT AND SAND S TORAGE BINS ON GALLERY.

The parties directly responsible for the operation of the new foundry are E. E. Brown, general superintendent, and T. R. Logan, foundry foreman. The design and construction of the shop were looked after by the E. G. M. Cape Co., general contractors, Montreal, Mr. T. A. Somerville having been in charge of the work.

LARGE TESTING MACHINE.

A TESTING machine with a capacity up to 10,000,000 pounds, and reputed to be the largest in the world, has been installed in the laboratory of the Bureau of Standards at Pittsburg, Pa. The machine, according to details published in the Engineering Record, has been designed to test a 60 ft. column vertically, and it consists mainly of two large heads, each weighing approximately 30 tons, and four straining screws, 13½ in. diameter, placed upright at the corners of the machine. These screws support the upper head and enable it to be raised or lowered, to accommodate the length of column to be tested, by four nuts operated simultaneously through gearing. On the lower head are mounted the cylinder ram, and lower platen, and the pressure is applied to the ram by means of a three-plunger variable stroke pump, worked by a 15-h.p. motor, which forces oil into the cylinder.

INDUSTRIAL ACCIDENTS.

ACCORDING to the record of industrial accidents compiled by the Department of Labor, that for the month of September shows that 89 workmen were killed and 419 injured; a total of 508. Compared with a record for August; this is an increase of one fatal and 114 non-fatal. The trades and industries in which the greatest number of accidents occurred were: steam railway service, in which there were 28 fatal and 123 non-fatal; metal trades, with 3 killed and 72 injured; mining, with 10 killed and 42 injured; and the building trades, with 10 killed and 33 injured.

THE CANADIAN STEEL INDUSTRY.

IT is understood that as a result of the representations recently made to the government by the steel interests, a special commission will be appointed to investigate their claims. The steel men have placed in the hands of Hon. W. T. White, finance minister, an exhaustive factum, setting forth strong arguments in favor of increased protection, and have asked among other things for a special expert commission to probe the whole question. This they claim would result in increased protection, which would place them upon a more equal basis with foreign manufacturers. They assert that the steel industry should be dealt with separately, and by experts; that their demands are of vital importance and urgency, and should not be subjected to delay, which would be inevitable were they left to be dealt with by the proposed tariff commission. It is known that at least one or two of the Western Conservative Members of Parliament are not in favor of increasing the tariff on steel or anything else, and these would wish to be heard.

There are indications on all sides that the tariff will this session take rank second only in importance to the naval bill in the questions which are to come before the House.

EDUCATION OF MANUAL WORKERS.

IN the course of his presidential address to the West of Scotland Iron and Steel Institute Mr. Walter Dixon referred to several points in connection with the education of manual workers. He stated that, over a somewhat extended period and a wide area, he had made inquiries among those who had collectively the control of about 200,000 men in the iron and steel and allied industries, with the following results:—

Deductions From Experience.

(1)—It was the unanimous opinion that any book-learning outside the rudiments of the "three R's" was a matter outside the requirements of the avocation of 90 to 95 per cent. of the usual manual workers. In other words, the work these men were called upon to do would be as efficiently, as successfully, and as expeditiously performed if they had no school education whatever beyond the "three R's."

(2)—Of the remaining 5 to 10 per cent., among whom were to be found the charge-men, foremen, and other leaders, most would attain to the leading positions in which they found themselves through and by their own initiative, if three-quarters of the existing aids to learnings were abolished; and the plethora of educational facilities did not raise more than about 1 or 2 per cent. from the worker to the overseer stage. There was a further widespread opinion —it might almost be called a unanimous opinion—that as regards the 90 to 95 per cent., not only would the work be done equally well and efficiently were the workmen devoid of their present so-called "education," but it would be done more expeditiously and more satisfactorily, inasmuch as there would be less unreasonable restlessness and less unreasonable discontent, the inevitable result and the danger of a universal "little knowledge," causing the men to be a constant and easy natural prey of those who had the little more, though equally inadequate, knowledge.

(3)—A further unanimous opinion was that leaders, foremen, and overseers were in an overwhelming degree born, not made, and therefore that all forced school education beyond that already indicated—at least all forced technical education—was, for the majority whose lives must be devoted to manual labor, not necessary—indeed, perhaps harmful.

The Aims of Education.

The president said that while he appreciated that many things might be said counter to or in modification of these conclusions, he put them forward as indicative of the opinions of the leaders of certain industries, and his investigations into other industries far removed from that of iron and steel assured him that in the main they had the approbation of those who controlled the majority of our industries. This being so, did it not call for a review of our educational methods, and might it not be possible to put our education on lines more suited to the conditions under which we lived? If it was a fact that education, as ordinarily understood, was a thing apart and outside of the avocation of most of our workmen, should not the education be designed in the main for the benefit and purposes of their recreative hours, giving up the idea that any material benefit was to be derived from technical education other than the best of all technical education — viz., that which men received in the course of their daily work? It was widely alleged that the effect of artificial forcing upon masses of partially-developed minds was largely, if not mainly, to spoil what would otherwise be good workmen, and to manufacture a half-efficient, half-developed, and constantly discontented class of aspirants to positions of responsibility and trust for which they were entirely unfitted.

National Dependence on Industrial Workers.

He was not prepared to offer suggestions for change beyond saying that so long as the existence of any nation depended upon its industries there must be men who were prepared to do manual work, men who regarded such manual work as an honorable avocation, and not as slavery—a term which was now—largely, as he believed, owing to our educational methods—applied to many manual avocations. It must be recognized that the mechanical developments of the last half-century had done away in a large measure, and for ever, with the possibility of the interest which a man could once take in his daily work, inasmuch as few men now made anything, but only a very small portion of something. It must further, be recognized that, under the reign of industrial competition, the hours of labor were likely to be hours of stress, and that when a man had finished his labor it was only right that he should have hours of reasonable recreation.

It was with a view to making these hours of recreation worthy of the nation that he felt our educational methods might and would ultimately be altered. This time would the more quickly come when we ceased to lose sight of the fact that education so-called—either technical or otherwise—to which our educational enthusiasts of to-day would more or less exclusively devote so many of the earlier years of every man's life, was only one—and that by no means the most important—of the factors essential to every one of the men who could possibly rise above the purely manual worker. Of these other factors, an inborn common sense and natural level-headedness might be said to be the most important. While, therefore, many of the subjects — if needs be, all the subjects — which were taught in our schools at present might be continued, he thought the point of view and the object for which they were taught might be largely remodelled, and the subjects so treated that each student might in some way get that which was commensurate with his mental and relative physical status.

ELECTRIC SMELTING OF CANADIAN ORES.

THAT the electric smelting of Canadian ores is a practical commercial possibility has been demonstrated, and will be so reported in an announcement now being prepared by the Mines Department. The report will cover results obtained with the 100-ton furnace installed at the Soo in 1906, and with the perfecting of the process in Sweden.

The announcement is of great importance to Canada, and especially Ontario. Hitherto the extensive iron deposits of Ontario have been scarcely touched because coal had to be imported, and the ore contains a high percentage of sulphur which could not be removed with blast furnaces.

LIQUID FUEL.

AT the October meeting of the New York Railway Club, a paper dealing with liquid fuel was presented by W. N. Best. The author stated that liquid fuel is often used with burners that do not thoroughly atomise the oil and evenly distribute the heat throughout the firebox or the charging space of the furnace. A burner should really form a flame to fit the length and width of a furnace as evenly as a blanket covers a bed. It should be capable of atomising fuel of any gravity procurable in the open market without either clogging or carbonizing, no matter whether it be fuel oil of very light gravity or crude oil, oil tar or coal tar. A burner is not worthy of consideration unless it enables the operator to burn any liquid fuel, for no manufacturer should be limited to the purchase of one particular kind of oil.

The author went on to say that a burner should be of such construction that it could be adjusted to make a long narrow flame or a broad, fan-shaped blaze, and each burner should be thoroughly tested so that when it left the

shop where it was made, the manufacturer would know that it would fill the requirements for which it was furnished. A burner, having the oil orifice below the atomiser orifice and independent of it, renders efficient service because there was no liability of the oil solidifying or carbonising over the atomiser slot at the nose of the burner.

NOISY SPUR GEARS.

IN an article entitled "Gear Data for Motor Applications," the author, Mr. C. W. Drake, points out that spur gears ordinarily begin to make a noticeable noise at pitchline speed of about 600 ft. per minute, but under average conditions may not become disagreeably noisy with pitchline speeds under 1,200 ft. per minute. The amount of noise allowable depends on the noise made by surrounding machinery, on the character of the workmen, and on the nature of the work in the vicinity. A noise that would be unnoticeable in a boiler shop might be exceedingly disagreeable in a shop that was otherwise comparatively quiet. Where noise is not a limiting feature, there is no limit to allowable pitch-line speeds, except the increased wear and depreciation of the motor, gears, and driven machine; but depreciation may become a very important factor with high pitch-line speeds, say, 2500 ft. per minute, or sometimes even less.

CHILLED IRON CAR WHEELS.

ACCORDING to the report of the Interstate Commerce Commission there were in service on June 30, 1910, 2,133,531 freight cars, and as eight wheels are needed to equip a car, there were 17,068,248 wheels in service at that time under freight equipment alone. Ninety-five per cent. of these were chilled iron wheels, while the numbers used under passenger cars, locomotive tenders, and on private car lines run up into the hundreds of thousands.

The chilled iron car wheel is really composed of three parts—the hard tread, soft plates, and a soft hub. The tread, or running surface, is as hard as the hardest steel, and because of this hardness it becomes polished in service and thus reduces the friction between the wheel and the rail. The plates are soft, thus insuring the necessary structure to carry heavy loads and to resist temperature changes and the resultant stresses due to brake application. The hub is soft, so that the wheel may be easily machined for axle fit.

The Master Carbuilders' Association specifies three classes of wheels for cars of different capacities, 625 pound wheel for 60,000 pound cars, 675 pound wheel for 80,000 pound cars, and 725 pound wheel for 100,000 pound cars. As the capacities of the cars have increased, the weight of the wheels has increased, but not in the same proportion. For an increase in car capacity of 66 2-3 per cent., the weight of the wheel has increased only 16 per cent., while the increase in the weights of the axle and the car body are 58 and 43 per cent. respectively. The tendency of the railroads is to increase the capacity of the cars beyond 100,000 pounds, but while axles have been designed for 140,000 pound cars, no wheel has been specified for this service. The chilled iron car wheel makers are, however, placing in service wheels to carry this and even greater loads. Their use under tenders of 10,000 gallons capacity and 150,000 pounds ore cars shows that there is scarcely a limitation to their employment, and they are standard because of safety, economy, and adaptability.

Service and Cost.

The important service that the chilled iron wheel is rendering is performed at a minimum cost. A chilled iron car wheel is sold in the market at an approximate differential of $3.50, and the net cost to the railroad is the difference between the selling price and the old wheel which is taken in part payment for the new one. These wheels are guaranteed for a certain period, and in case the wheel does not give the service for which it is guaranteed the loss comes on the manufacturer. Under some conditions of service the 625 pound wheel is guaranteed for six years' minimum service, the 675 pound for five years, and the 725 pound for four years. The average life, however, greatly exceeds these figures, approximately double the guaranteed service being secured from each of the three wheels. The cost per car based on a differential of $3.50 and an average life of 12 years is therefore approximately $2.33.

It is stated that 85 per cent. of the repairs to freight cars are due to shocks consequent on coupling, etc., thus damaging bolsters, draft gears, and other parts of the car. Analysis will show that the wheel expense is insignificant compared with the repairs for other parts of the car. If any other wheel is substituted for the standard chilled iron wheel it must be demonstrated by competitive tests that it is more economical per ton mile, that it is better adapted to the service for which it is intended, and that it is safer. It must be borne in mind that an added cost of $10 per wheel would involve the expenditure of $80 per car. The interest on this investment at 5 per cent.. would be $4 per car per year, which is more than the renewal cost of the standard chilled iron car wheel,

THE CANADIAN COAL OUTPUT.

NOVA SCOTIA and British Columbia will in future have to fight for supremacy in Canadian coal production. Nova Scotia, for many years, has led the way. In 1911, according to the figures of the Department of Mines at Ottawa, that province produced 6,994,000 tons with a value of $14,050,000. British Columbia was second, with over 2,000,000 tons, and a value of nearly $8,000,000. The prediction that the coal mines throughout British Columbia, and particularly on Vancouver Island, will be among the most important in the world, may not prove far wrong.

British Columbia already holds some notable records. Since 1836, for instance, it has produced over 34,000,000 tons of coal, with a value of $109,000,000. In the past ten years its production has exceeded 17,000,000 tons with a value of approximately $55,000,000. When the industry gets the capital necessary for its exploitation, the Pacific Coast Province will be setting records not to be easily surpassed.

Coal Imports.

Despite the large coal resources known to exist in Canada, production in recent years has been only about half the estimated home consumption. The remainder of our requirements are supplied by imports, chiefly from the United States. In 1911, for instance, Canada imported coal classified as follows:

Coal	Tons	Value
Bituminous ...	8,905,815	$18,407,603
Slack	1,632,500	2,090,796
Anthracite .. .	4,020,577	18,794,192
Total ..	14,558,892	$39,292,591

No question as to the existence of markets can be raised. The demand is rapidly increasing as our population grows, and our industrial life quickens. yet one trouble in a new country which has unlimited natural resources and opportunities, is that certain industries must wait for men and money. The coal industry of the Dominion has been satisfied to a certain extent with both development factors, but can well absorb legitimately many millions of capital and much labor to bring to the surface good coal in almost countless tons.

Statistical Data.

The following figures for several years, taken at random from official returns, show the distribution of British Columbia's coal production in tons.

Year	Production	Home consumption	Sold for export
1900 ..	1,599,851	685,667	914,184
1905 ..	1,737,010	1,089,667	647,343
1909 ..	2,326,899	1,585,232	741,667

Last year 573,888 tons of British Columbia's coal was exported to the United States, and 38,808 tons to other countries.

Some Recent Developments at the C.P.R. Shops, Winnipeg

By C. T. R.

This article deals with the manner in which the total production of these large railroad shops was recently greatly increased. The re-arrangement of the locomotive shop was of a radical nature, the boiler work having been entirely removed to a new shop, and the transfer table placed outside. The lay-out of the machine shop was also entirely revised with very beneficial results.

SOME extensive changes and additions were recently made in the layout of the Winnipeg shops of the Canadian Pacific Railway. These embodied a new boiler shop in a building independent of the main locomotive shop, a new steam shovel shop, which incidentally made the tender shop larger, a new upholstery shop and wings to the car shop, and several smaller buildings. As a result of the removal of these departments into new quarters, an almost total rearrangement became necessary.

Before these changes, the locomotive transfer table, which is to be seen in plan along the north side of the locomotive shop, was inside the shop in the centre section at the east end. The erecting department now extends the whole length of the north side of the shop, having formerly occupied both sides of the east end. The old arrangement had its advantages, in that the erecting pits were on both sides of the transfer table, the arrangement giving the largest number of pit entrances for the least movement of the table. Its disadvantages were that it occupied a large amount of valuable space and did not allow of the expansion which the increase of power has required the shop to handle. The pits at the extreme end of the shop were, and are still, used generally for light repairs and for final work before despatching of repaired engines. Unwheeling is done on the 100-ton stationary overhead crane in the centre of the shop and from this track all the other shops are laid out. The erecting shop is served by two overhead travelling cranes of 20 tons capacity each and also by 25 ft. swing jib cranes of 1½ tons capacity; one jib crane being placed between every two pits. These jib cranes handle all front end work and relieve the overhead travellers to a great extent. The whole shop is served by a system of industrial tracks, its main aisle running parallel to the erecting shop. There are two tracks on this aisle, one up and the other down, with feed lines connecting at right angles at various points to facilitate the handling of the work.

VIEW IN THE YARD—C.P.R. SHOPS, WINNIPEG.

Erecting Shop Tool Stores, etc.

A feature introduced in the erecting shop is a tool store, with a desk inside, for each gang charge hand. On one side of each tool store is a lathe and an emery wheel, while on the other side is a small radial drill, the countershaft being arranged on the top of the store. These machines handle the work of the gang as required. The departments that are an adjunct to the erecting shop, namely, the jacket gang, pipefitters and carpenters, are located in direct contact with the erecting shop, so that material transfer is as short as possible. Another new feature of the main shop is the centering of the blacksmiths in the locomotive shop. All repair to motion, springs, brake work, etc., except the very heavy work, is brought to this point, where it is handled more expeditiously than was before possible.

GENERAL PANORAMIC VIEW OF THE C.P.R. SHOPS, WINNIPEG.

New Boiler Shop.

The new boiler shop is located towards the east end of the locomotive shop on the north side of the transfer pit. It is 286 ft. long by 120 ft. wide and has ten pits that are in direct communication with the transfer table. The boiler shop has two bays, each 60 ft. wide, one bay being divided into pit tracks and the other forming the manufacturing floor. The south bay—(that having pits)—is served by a 10-ton overhead traveller, while the north side (manufacturing floor) is served by a 20-ton overhead traveller, both travellers running the whole length of the shop. Engines coming into the shop solely for boiler repairs are run to one of the pits, where they can be operated on without taking up erecting shop space. There are three pit tracks running across into the manufacturing floor. These are used to make heavy lifts on or off an engine with the 20-ton crane. At the east end of the shop is the hydraulic riveter, which is served by a transverse overhead traveller of 20 tons capacity. This traveller also has an auxiliary 5-ton hoist for use on light work. The transverse runway is set high above the shop runway so that a boiler may be suspended on end for riveting. The relative heights of crane runways are as follows: 10-ton crane, 20 ft. high; 20-ton crane, 30 ft. high; and 20-ton tower crane, 42 ft. high.

A complete hydraulic plant is in operation and a pressure of 2,000 pounds per square inch is used to operate the hydraulic punch and shears, hydraulic riveter, hydraulic flange press and hydraulic superheater tube swage; these machines being used for the heaviest class of work. The other machines are arranged with motor drives, individually or in groups according to location. At the extreme west end of the shop is the tube department, the north side of which is employed exclusively on small boiler flues, while the south side handles superheater flues. Directly outside the shop, as will be seen in general plan, are the tube storage tracks and house. A small transfer turntable is used to handle trucks containing tubes in and out these tracks, the whole forming a complete and expeditious method of handling tubes without in any way interfering with the progress in the shop.

The entire shop is well covered with individual jib cranes, so that waiting for crane service is reduced to a minimum The large flange furnace, all tube furnaces and rivet furnaces burn fuel oil. The shop is piped with acetylene gas for use in connection with oxy-acetylene welding and cutting outfits.

Boiler Shop Tool Store.

The tool room is centrally located on the north wall and is arranged with a view to quick handling of tools. A check system is in vogue by which an accurate tab is kept on tools. Checks received are hung over the box taken from, and all boxes are labelled with their contents. Tools are always turned in overnight and checks returned. Sufficient racks are provided for everything, and every-

SOME OFFICIALS OF THE MOTIVE POWER AND CAR DEPARTMENTS, C. P. R., WINNIPEG.

1. C. H. Temple, Supt. of Motive Power. 2. W. E. Woodhouse, Asst. Supt. of Motive Power. 3. G. H. Eaton, Asst. M.C.B. 4. R. A. Pyne, Supt. of Shops. 5. G. Humphries, Chief Clerk to S.M.P. 6. R. R. Neild, Gen'l Loco. Foreman. 7. T. G. Armstrong, Gen'l Car Foreman. 8. E. T. Spidy, Asst. to Gen'l Loco. Foreman. 9. H. S. Hood, Schedule Inspector. 10. J. F. French, Chief Clerk to Supt. of Shops. 11. G. Powles, Foreman Erecting Shop. 12. S. J. Pentland, Foreman Machine Shop. 13. W. Bathie, Asst. Foreman Machine Shop. 14. W. Scott, Asst. Foreman Machine Shop. 15. T. W. Lowe, Gen'l Boiler Inspector. 16. J. Gollah, Foreman Boiler Shop. 17. T. Hinds, Asst. Foreman Boiler Shop. 18. R. Wilkinson, Foreman, Tube Shop. 19. W. Lowe, Foreman, Tender Shop. 20. J. Eddy, Foreman, Iron Foundry. 21. W. Shields, Foreman, Blacksmith Shop. 22. J. McCallum, Steam Shovel Inspector. 23. R. Turner, Shop Engineer. 24. R. Quinn, Foreman of Road Material. 25. H. Sloan, Foreman, Pattern Shop. 26. H. Patton, Chief Engineer, Power House. 27. C. H. Jones, Store Order Foreman. 28. R. H. Hart, Foreman, Electrical Department. 29. A. Martin, Foreman Repair Track. 30. J. Ritchie, Foreman Coach Shop. 31. H. Osborne, Foreman, Car Shop. 32. G. Lockhart, Foreman, Planing Mill. 33. A. Gamble, Foreman, Coach Paint Shop.

thing is in its place. The foreman's office is located next to the tool room and a men's lavatory on the opposite side of the latter; the whole being housed in a brick lean-to against the main building.

Locomotive Machine Shop.

The machine shop also underwent considerable change and all gangs were rearranged to the best advantage. More machinery was added and some of the older machines were discarded. The machine shop now covers an area of 26,000 square feet, which is about 20 per cent. more than previously occupied. The several gangs are placed in the most suitable position for their various classes of work and for the expeditious delivery of parts from and to the engines. Thus, the driving box gang is located where the boxes can be operated on close to where they are stripped from the wheels. The arrangement of the machines in this department is shown on this page. The wheel gang is located directly at the end of the unwheeling track, which leads directly into the tire house where tires are removed and replaced. All other machinery is arranged in the order of the subsequent operations, so that each job will have the shortest and least number of moves. The rod gang is located directly facing the erecting shop and delivers finished material to each engine at the pit. The general manufacturing gang for the stores is located at the extreme end, where it least interferes with progress of locomotive work. Two 7½-ton overhead travellers serve this shop for heavy traffic.

The machine shop office is located in a central position on the south wall. The tool stores and petty stores are in practically the centre of the machine shop, where they are most convenient for everybody. Directly by the side of the tool store is the toolmakers' department, where all repairs to tools, air motors, etc., are made, and new taps, cutters, jigs, etc., are manufactured. As the foregoing shows, the locomotive department has been changed considerably and the output of the shop much increased. The locomotive shop is 792 ft. long and 163 ft. wide, while the transfer table outside the shop traverses a distance of 1,040 ft. All other departments of the works were equipped with extra machinery at the same time, the whole of which has combined to produce the desired result of increased efficiency and output.

INTERIOR OF NEW BOILER SHOP.

On page 362 is seen an interesting group photograph of the chief officials and foremen of the motive power and car departments.

GENERAL LAYOUT OF THE C.P.R. SHOPS AND YARD, WINNIPEG, MANITOBA.

THE EASTERN CAR CO. PLANT.

WORK on the plant of the Eastern Car Co. at New Glasgow, N.S., is progressing satisfactorily under the able supervision of H. H. Lane, of Detroit, a recognized expert with large experience in the designing, construction and operation of car building plants. Mr. Lane has done much of this kind of work for the American Car and Foundry Co., and he recently rebuilt the car plant at Michigan City for the Haskell & Barker Co.

The Eastern Car Company will have the benefit of four important factors, in addition to an absolutely modern plant. These are, that the works are close to fuel supplies, raw material is at its very doors, Pictou County has a splendid quality of labor and the location gives economical means of reaching the market. The Nova Scotia Steel and Coal Co.'s works, adjoining, obviate the necessity for carrying large stocks of steel, everything of this kind being available as required. The East River is being deepened to 34 feet and stocks of Southern pine, pig iron and other heavy material will be deliverable by ocean-going steamers. The Nova Scotia Steel and Coal Co. own large areas of timber lands and that company's mills, connected by the I. C. R. with the Eastern Car Co.'s plant, ensure a ready supply of local timber and wood. The ability to secure freight, so that the new cars can be sent loaded to Montreal and the West is an important matter. A large part of the output can be loaded at the works of the "Scotia" Company, and instead of paying freight for the shipment of empty cars, an allowance will be obtainable from the I. C. R. for their use with a load.

RECORD STEEL OUTPUT.

THE October output figures of the Dominion Iron & Steel Company just issued show the month to have been the most successful yet experiencel in its history. The figures are as follows:

Pig iron, 31,090 tons; ingots, 29,975 tons; blooms, 27,880 tons; rails, 15,656 tons; rods, 8,868 tons; coke, 50,540 tons.

The standard records in the pig iron, bloom, rod and coke departments were smashed, as well as those in the sulphate ammonia, wire and nail departments. The exact figures for the last three are not available at the moment of going to press.

The recent blowing in of the new blast furnace, bringing the number up to five, is given as the reason for this splendid output. A sixty blast furnace is now in the process of construction.

The Twin Cities of Fort William and Port Arthur, Ont.

By J. H. Williams

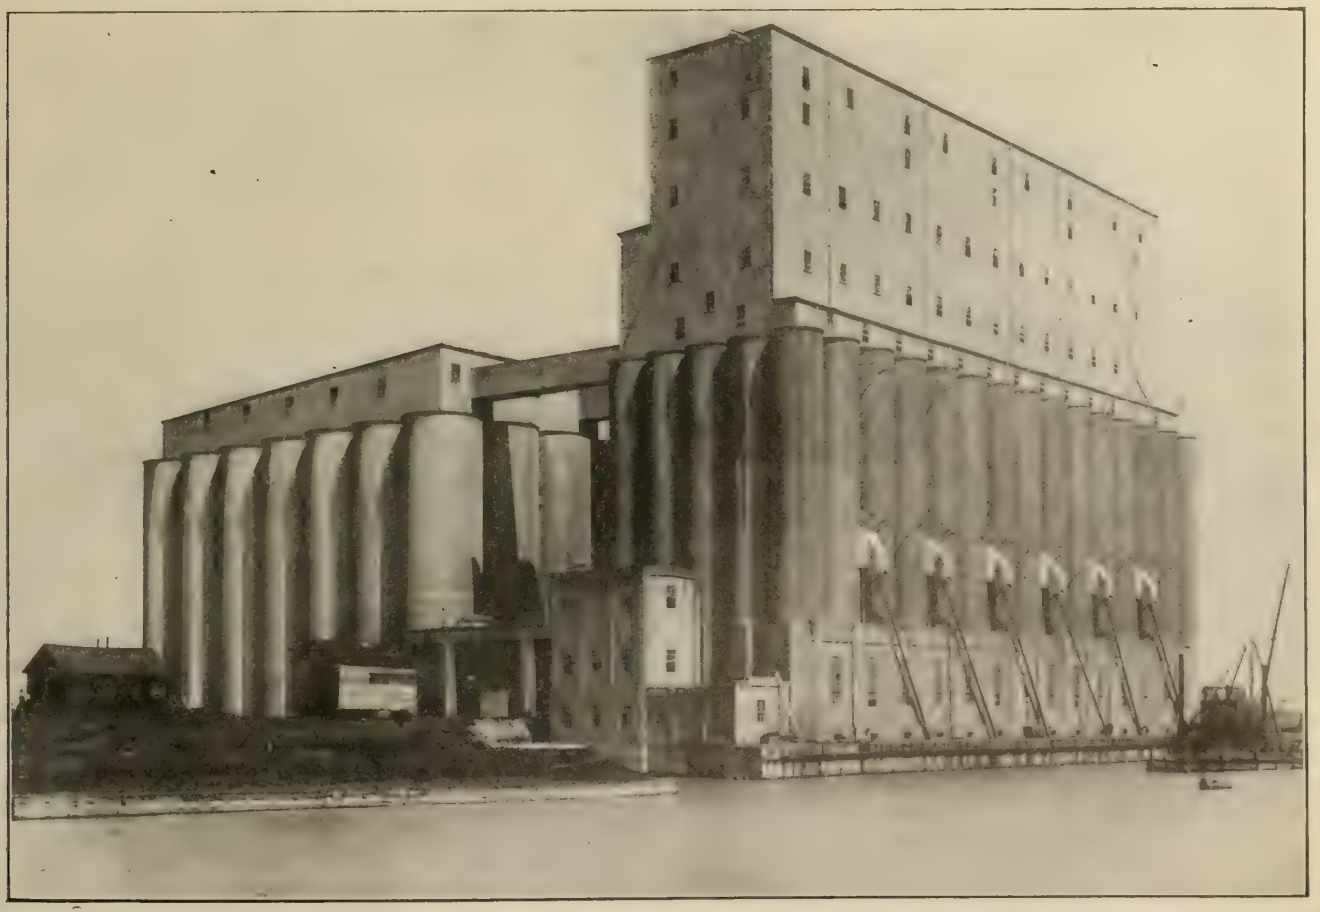
The future of these two ports is absolutely assured. However enterprising railroads may be, and however many of them are built from East to West, Thunder Bay on Lake Superior must always be the head of a vast navigation; and water transport, whatever be the inventions of the remote future, can scarcely lose all its advantages.

IN spite of their comparatively isolated location, far from any other large centre of population, the two cities of Fort William and Port Arthur have of late years gone ahead by leaps and bounds in a manner comparable to that of the most flourishing cities of the Far West. With a combined population of some 37,000, and an unsurpassed situation as regards water borne traffic, the industrial outlook for the twin ports is of the brightest, not only on account of their advantageous position at the head of the Great Lakes, but also because they are the bulk-breaking points for both eastbound and westbound shipments.

Fort William enjoys quite a respectable antiquity, having been founded in the year 1800. In those early days it was the chief trading station of the great North-Western Fur Company of Montreal, and life there would seem to have been sufficiently interesting. In the words of Mr. A. G. Bradley, the well-known writer on Canadian subjects: "Fort William was built in 1800 and in and around its walls gathered in their hundreds the Indians and half-breeds of the West, with their skins and peltries. It was strongly fortified, and was occupied by quite a garrison of the company's employes. Dr. Bryce, who has had access to their old journals, quotes freely from them in his memoir of the Hudson's Bay Company, and we are told of the wild revels that at Christmas and other festive seasons used to transform partners, clerks and the whole bureaucracy of this remote settlement into uproarious schoolboys. In the great dining hall, sixty feet long, and hung with pictures of the Nabobs of this North-Western wilderness, liquor flowed like water, and the revellers, seated in a long row, one behind the other on the floor, using tongs, shovels and brooms as imaginary paddles, ran imaginary rapids, and shouted the boat songs of the woods, while Indians, half-breeds, and coureurs-de-bois looked on in wonder and admiration."

Fort William retains no trace of its ancient character. Where schooners used to lie awaiting their load of furs great steamships now receive their burdens of wheat from rows of the largest elevators in North America. Port Arthur is six miles distant from Fort William and straggles in picturesque fashion up a dry hillside on which are built many fine residences. The view over Thunder Bay is very fine, and as the city faces to the east, the early riser is frequently rewarded by a glorious sunrise.

It will perhaps be best to treat the two cities separately; and since it has considerably the larger population we will commence with Fort William.



Grand Trunk Pacific Elevator, Fort William. This is the largest single elevator in the world. Present capacity 3,500,000 bushels. A second annex to hold an additional 2,500,000 bushels is rapidly nearing completion.

Fort William.

The city lies low at the outlet of the Kaministiquia River, which here empties itself into Thunder Bay by three mouths known as the Mission, the McKellar, and the Kaministiquia Rivers respectively. These three outlets are being dredged to a depth of 25 feet and a width of 400-

View in the Grand Trunk Pacific elevator at Fort William. This shows one of the five 36-inch rubber belts that transfer grain from the working house to the annex. In the distance is the tripper.

500 feet as fast as conditions will allow, and will eventually give a dock frontage of 18 to 20 miles.

The facilities here found for rapidly handling grain between cars and boat are probably unexcelled at any port in the world. There are a dozen elevators scattered along the banks of the river, their present total capacities amounting to some 22,000,000 bushels. Of these that of the Grand Trunk Pacific Railway is by far the largest, having a capacity of three and a half million bushels. This forms the largest single elevator in the world and is absolutely fireproof, being constructed entirely of reinforced concrete and steel. Its cost was in the neighborhood of $1,250,000. A second storage annex is now being added, which will bring the capacity up to six million bushels. It will eventually be enlarged to ten million bushels and will then form one of four similar units which the G. T. P. have planned to erect at their Fort William terminals. The company will thus eventually have storage room for forty million bushels.

The G. T. P. elevator was constructed by the Canadian Stewart Co., Montreal, and represents the very latest ideas in elevator design. The track shed stands between the working house and the storage annex, and has four tracks, on each of which there are five receiving pits below track level. Thus, twenty cars can be unloaded simultaneously. The disposition of the grain on being received will depend upon its grade, its condition or its identity. It may be elevated and stored in the annex there to await shipment; if wet it may undergo the drying process; cleaning and separating may be necessary; or by a convenient system of spouting it may be delivered to cars or vessels.

All wheat cleaning is done on the ground floor, there being five sets of cleaning mills, three mills to a set. The grain is elevated by 19 legs, there being 5 receiving legs, 5 shipping legs, 5 cleaner legs, 1 flax leg, 1 screenings leg, 1 special oats leg and 1 leg to the drier. From the receiving pits in the track shed the grain travels on 36-inch rubber belts to the foot of the receiving legs in the working house. Each leg is equipped with a double row of 15 x 8 x 8-inch buckets, and has a capacity of 18,000 bushels per hour. On reaching the top floor in the cupola the grain is weighed in five large hopper scales, each of which has a capacity of 120,000 pounds (2,000 bushels of wheat) and is equipped with printing and recording mechanism. After weighing the grain is distributed to the various storage bins in the working house or the annex. Five 36-inch 4-ply belts carry grain from the working house cupola to the annex and five similar belts in the basement complete the return circuit to the shipping legs. A 42-inch 4-ply reversible belt conveyor in the cupola transfers grain lengthwise of the elevator from the weigh-scales to the annex belts, the car spouts or the working house bins.

Power Equipment, Etc.

Power is purchased from the Kaministiquia Power Co., who deliver 3-phase current at 22,000 volts, 60 cycles. In a transformer house attached to the elevator this voltage is reduced to 550. Thirty-seven motors of the squirrel cage type are installed throughout the elevator and develop a total of over 2,500 H.P.

Artificial lighting is afforded by some 800 incandescent drop lights of 16 c.p. each. Each hanging lamp is equipped with a wire guard, and the cables are enclosed in armored flexible conduits. The superintendent's office on the ground floor is connected by telephone

Waterfront of the Great Lakes Dredging Co's. plant on the McKellar River, Fort William.

A corner in the machine shop of the Great Lakes Dredging Co., Ltd., at Fort William.

with all departments and the operation of the elevator is further facilitated by speaking tubes, electric bell signals and a series of red and green signal lights at each of the receiving and shipping legs.

Coal Handling Plants.

The twin ports are, of course, the transhipping points for enormous quantities of west-bound coal, the Customs returns for the year 1911 showing that during the previous season of navigation over 3,000,000 tons were received at Fort William alone. The C.P.R. old coal dock handled 1¾ million tons, the balance having been dealt with by the Fort William Coal Dock Co., Ltd. This company's plant was established on the Mission River near the G.T.P. terminals in October, 1910. The coal handling equipment was installed by the Hyle & Paterson Co. It consists of two bridges, equipped with 2-ton buckets and operated by 150 H.P. motors. Contracts for doubling the capacity of the plant have just been completed by the Brown Hoisting Machinery Co., Cleveland. The new tower has a single bridge, with a 5-ton bucket and will be able to unload 3,000 tons of coal a day, which is equal to the capacity of the two old bridges combined.

Last year much coal had to go West via Duluth and Superior, owing to lack of sufficient apparatus to handle it at Fort William and Port Arthur, but as soon as the new terminals of the G.T.P. and the C.P.R. are completed this condition of affairs will, it is hoped, be a thing of the past. The coal dock at the C.P.R. terminals, which has just been completed, is of the most modern description and has a total storage capacity of 2 million tons. There have been installed two Hulett electrically operated 8-ton coal unloading machines, one 9-ton rehandling bridge, three 35-ton scale lorries, and about 3,000 ft. of bin and trestle system, as well as Christy box car loaders. It is expected that this

Ice breaker "James Whalen" at work in Port Arthur harbor. She is the property of the Canadian Towing and Wrecking Co., Ltd., Port Arthur.

Great Lakes Dredging Co's. Floating Drydock with tug "Sarnia." The dock will lift boats of 1,000 tons, drawing 15 ft.

In addition to this huge elevator there are a dozen others, five of which are owned and operated by the Canadian Pacific Railway. Of these the largest, known as C. P. R. Elevator D, has a present capacity of 1¾ million bushels, and is now being enlarged to hold an additional 1,600,000 bushels.

Mention must also be made of the large flour mill and elevator of the Ogilvy Flour Mills Co., Ltd. The mill is fitted throughout with the very latest equipment and has an output of 3,500 barrels daily. The elevator is of reinforced concrete and has a storage capacity of 1¼ million bushels.

The two grain elevators of the Canadian Northern Railway at Port Arthur. Their combined capacity is 7,000,000 bushels. Additions are about to be made with a view to doubling this capacity. The illustration shows the elevators as seen from the lake.

plant will very readily handle the largest boats that are in use on the great lakes, in one day's time—10 hours.

To give an idea of the size and capacity of these machines it may be mentioned that the motor equipment on each of the coal unloaders consists of a total of 550 h.p. and the bridge is equipped with motors aggregating 700 h.p.

All this coal handling equipment was supplied and installed by the Wellman-Seaver-Morgan Co., Cleveland.

The Atikokan Iron Co's. Blast Furnace, Port Arthur. Output 200 tons daily. The Roasting Plant on the left of the track has a daily capacity of 500 tons of ore.

Hydraulic Dredge "Shuniah" digging steamboat channel and reclaiming land at Western Drydock and Shipbuilding Co's. plant, Port Arthur. The "Shuniah" forms a unit in the large fleet of the Great Lakes Dredging Co., Ltd., Port Arthur.

The Grand Trunk Pacific Railway are also constructing extensive coal docks with a storage capacity of one million tons. These are located at their terminals on the Mission River, opposite their grain elevator.

Great Lakes Dredging Co.

Another prominent concern located on the water front is the Great Lakes Dredging Co., Ltd. This is really a Port Arthur company, since its offices are in that city. However, its yard and workshops are in Fort William on the McKellar river, and it is generally looked upon as a Fort William industry. The company does a general dredging business and has a large fleet of dipper and suction dredges, tugs and scows. The plant consists of machine shop, pattern shop, blacksmith shop, boiler shop and storehouse. In their yard the company build all their wooden dump scows, derrick scows, dredger hulls, etc., and look after the complete upkeep of all their outfit. The equipment includes a small floating drydock shown on page 367. The dock is 100 feet long by 70 feet wide and will lift boats of 1,000 tons displacement and drawing 15 feet. It is fitted with two sets of pumps, one of the plunger type and the other of the motor-driven centrifugal type; so that either steam or electricity may be used as circumstances may render most convenient.

The Canada Iron Corporation, etc.

One of the largest industrial plants in Fort William is that of the Canada Iron Corporation. These works give employment to about 350 men.

The various buildings occupy a site of 22 acres on the left bank of the Kaministiquia River, about five miles from the city hall. They comprise machine shop, pattern shop and four foundries for the production respectively of general castings, car wheels, brake shoes and pipe.

In addition to this plant the Copp foundry employs a number of men, stoves being the principal output. As the Thunder Bay district abounds in iron ore the future of both the cities is linked with the exploitation of iron and steel manufacturing. The Canada Car & Foundry Co., have recently commenced the erection of a large plant in Fort William and a nut and bolt factory will be established in the near future, while other steel and iron industries are about to be located in Port Arthur, as will be hereafter mentioned. Thus it is clear that a very few years' time will see full advantage taken of all the natural resources of the district.

The Kaministiquia Power Co.

One or two concerns in Fort William generate their own power, but the very great majority purchase power from the Kaministiqua Power Co., Ltd., who have a hydro-electric generating station situated at the Kakabeka Falls, about 14 miles above Fort William. The present capacity of this generating station is 21,000 h.p., but the intake works, power house, etc., were built sufficiently large to allow of additional equipment being installed which will eventually bring the output up to 50,000 h.p. The rates charged are understood to be $23 to $25 per horse power per year of 365 days.

Port Arthur.

Port Arthur is picturesquely situated on a hillside, and in this respect has the advantage of Fort William, which stands on a flat, uninteresting site. Both cities have many fine residences, the number of these in Port Arthur being especially noticeable.

As is well known, the C.P.R. in the early days made Port Arthur their Lake Superior depot, but after a few

Two vessels in drydock at the plant of the Western Dry Dock and Shipbuilding Co., Ltd., Port Arthur. This dock is 700 feet long, 98 feet wide and has a depth of water over the sills of 16 feet.

years deserted the place and moved on to Fort William. This of course was a great loss to the former town, and to the outsider Port Arthur seemed destined never to be anything more than a residential city. However, its citizens never let their ambition and enthusiasm cool, and by and by Mackenzie & Mann came along with the Canadian Northern Railway, and promptly set about developing the water front, building docks, etc., until they have long since filled the blank left by the C.P.R.

As evidence of their faith in the future of the city as an industrial centre, apart from its importance as a grain handling port, the C.N.R. opened in March, 1911, a fine hotel of 110 rooms. This is known as the Prince Arthur, and occupies a commanding position overlooking Thunder Bay. The accommodation provided quickly proved inadequate and the hotel has, this year, been enlarged to 150 rooms.

C.N.R. Elevators, Coal Dock, etc.

A grain elevator is seldom a thing of beauty from an artistic point of view, but we think it would be difficult to find an example less objectionable in this respect than the C.N.R. elevator at Port Arthur, a view of which is shown on page 367. The elevator consists of two units, A and B, with a total capacity of seven million bushels. Each unit has a working house, which is tributary to a storage annex of 2½ million bushels. Elevator A was erected in 1901, the other being added three years later. The working houses are of wood, while the annexes are of the Barnett-McQueen Co.'s patented hollow tile construction. Both elevators are driven by steam, the engines and boilers being built by Goldie & McCulloch, Galt, Ont. Engine room A contains a single cylinder condensing Wheelock engine of 650 h.p., steam for which is provided by three return tubular boilers. Engine room B is equipped with a twin cylinder Wheelock engine of 1,000 h.p. This also runs condensing and is supplied by four boilers similar to those in A. These boilers also provide steam for a Hess dryer located in a separate building near power house B. This dryer has a capacity of 750 bushels per hour of tough grain or 500 bushels for damp or wet grain. The combined unloading and shipping capacity of the two elevators is: Unloading, 30 cars per hour; shipping 180.000 bushels per day. The C.N.R. are about to enlarge these elevators very considerably. Report says that their capacity is to be doubled.

This company's coal dock built in 1906, is also being greatly enlarged. When completed it will have a storage capacity of 500,000 tons and will be able to unload 1,200 tons per hour. This contract is being put through with all speed by the Barnett-McQueen Co.

The important plant of the Western Drydock and Shipbuilding Co., Ltd., at Port Arthur, forms one of the city's principal industries. This plant was described at considerable length in the issue of "Canadian Machinery and Mfg. News" for May, 1912, to which we would refer readers who are interested.

The Port Arthur Wagon Works, recently opened, is another important concern giving employment to 200 men.

View in the annex of C.N.R. Elevator "B," Port Arthur. Some of the bins are here seen full to the top with golden wheat from Canada's Western provinces.

DOCKS AT THE FOOT OF ARTHUR ST., PORT ARTHUR.

This firm will eventually turn out 15,000 farm wagons a year.

Among other concerns that call for mention is the Pigeon River Lumber Co., whose mills have an annual capacity of 50,000,000 feet of lumber. Stewart & Hewitson operate an extensive quarry and rock-crushing plant which is taxed to its utmost capacity, owing to the large demands for road-making and construction work.

Another important plant is that of the Atikokan Iron Co., who operate a blast furnace with a capacity of 200 tons per day. The ore is brought from the Atikokan range 126 miles to the West on the C.N.R., and is of a high grade containing over 60 per cent. of metallic iron. The company manufacture their coke from West Virginia coal in a range of 100 beehive ovens having a total capacity of about 150 tons per day of 24 hours.

The blowing engines for the blast furnace were built by the Southwark Foundry & Machine Co., Philadelphia. They have a capacity of 30,000 cubic feet of air per minute at 15 lbs. pressure, though 10 lbs is the pressure actually used. Steam for these engines is supplied by four Canada Foundry Co.'s double furnace water tube boilers, fired by the waste gases.

The Atikokan Iron Co., is a Mackenzie & Mann interest, and was started largely as an experiment. However, it turned out so successful that it was decided to follow it up by the establishment of a large steel works on the northern outskirts of the city. This will be an $8,000,000 concern and will turn out rails, angles, structural shapes, etc. The starting of such a plant will ,of course give a tremendous impetus to the city.

Another concern which is now starting work on a large scale is the Ontario& Western Car Co., Ltd., who are building a $5,000,000 plant to turn out steel and wooden cars of every type for steam and electric railroads, street railroads, contractors' dump cars, etc., etc. This plant will give employment to 1,000 men.

The Whalen Interests.

Mr. James Whalen, a long-time resident in Port Arthur, has numerous interests in that city. Besides being president of the Western Drydock & Shipbuilding Co., he is interested in the following concerns, viz:—The Great Lakes Dredging Co., Ltd., the Canadian Towing & Wrecking Co., Ltd.; the Canada Pebble Co., Ltd., and the Thunder Bay Contracting Co., Ltd. The last named company had the installing of much of the new coal handling plant of the C.P.R. at Island No. 1, Fort William, and are also putting in about 4½ miles of crib concrete dock at the G.T.P. terminals on the Mission River.

The Canadian Towing & Wrecking Co. have a fleet of eight tugs and three wrecking barges fitted with clam shell buckets for handling cargo. The barges are fitted with wireless telegraphy to enable orders to be transmitted to them from shore. When not engaged on wrecking work they are used for gathering sand and gravel from lake beaches for use in making concrete. The twin harbors are at present using some 60,000 cubic yards of sand and gravel annually. The ice breaker tug "James Whalen," belongs to this fleet and is illustrated on page 367. She was built in 1906 by the Polson Iron Works, Ltd., Toronto, and has done useful work each spring in hastening the opening of Port Arthur harbor. Her dimensions are:—Length overall, 108 ft.; beam, 24 ft.; depth, 14½ ft. Her cast steel propeller is 10 ft. 6 in. in diameter and is driven by a 20-40-36 fore and aft compound jet condenssing engine. Steam at 160 lbs. pressure is supplied by a Scotch marine boiler 12 ft. 6 in. in diameter by 12 ft. long. Her speed in summer is 11½ miles per hour.

The Canada Pebble Co., is a concern engaged in gathering granite pebbles for use in tube mills, and for grinding cement clinker, copper ore, etc. They are also used by paint manufacturers for grinding their lead. These pebbles are found in large quantities along the north shore of Lake Superior and are sorted by screens into sizes varying from 1½ to 4 inches, and are loaded into bags for shipment.

General Features of the Two Cities.

The intervening six miles between the two cities is traversed by a double track street car system, on which very fine cars of the pay-as-you-enter type give an excellent service. The system is owned and operated by the two municipalities as is the telephone service, which is efficient and remarkably cheap.

Both cities have well paved streets and fine stores, and are well provided with churches, schools and hospitals. Their growth in the last ten years has been truly wonderful and it is certain that their expansion during the coming ten years will be even more marked.

CALLS FOR MACHINE TOOL EQUIPMENT.

THE National Transcontinental Railway Commission has issued a list of machine shop equipment requirements, amounting in value to about $40,000. The following items are included:

One 80-inch motor-driven wheel lathe.

One 30-inch by 8-foot motor-driven planer.

One 4-foot motor-driven radial drill.

One 28-inch by 16-foot motor-driven gap lathe.

One 20-inch by 10-foot motor-driven double back geared engine lathe.

One 16-inch by 8-foot motor-driven high speed double back geared engine lathe.

One 20-inch motor-driven drill press.

One 16-inch motor-driven shaper.

One 4-inch motor-driven pipe machine.

One 2-inch motor-driven bolt cutter.

One 500-pound motor-driven power hammer.

One 36-inch motor-driven grindstone.

One 30-inch motor-driven band saw.

One 24-inch pony planer.

One 14-inch portable bolt lathe.

Two forge blowers.

Three portable cranes.

Two 400-pound anvils.

Eastern Car Co., New Glasgow, N.S.

Another large list calling for about 40 machines has been issued by the Eastern Car Co., New Glasgow, N.S. All the machines are for early delivery and are to be arranged for motor drive, but the motors are not to be included in the bids. Prices are to be made f.o.b. New Glasgow. The complete list is as follows:

Two 125-inch gate shears, 24-inch throat.

One 62-inch gate shear, 24-inch throat.

One double angle shear, 6 x 6 x ¾ inches mounted on turntable.

Two multiple punches, 120 inches wide.

One multiple punch, 125 inches wide and 18-inch throat.

One mill plate punch, 12 feet between housings.

Three open gap punches, 24-inch throat, 1½ inches through 1 inch.

Two open gap punches, 24-inch throat.

Two horizontal punches; gap 10 feet deep.

Two horizontal punches with four gagged punches adjusted horizontally, two inches either side of centre.

One No. 9 bulldozer, 24-inch stroke.

One No. 20 bulldozer, 20-inch stroke.

One No. 23 bulldozer, 16-inch stroke.

One 2-inch upsetter.

One 1½-inch upsetter.

One bar shear, 2 x 12 inches.

One bar shear, for 2-inch rounds.

Two Bradley hammers.

One hydraulic wheel press, steel pressure 200 tons, for 33-inch wheel.

Five axle lathes, with or without cranes.

Two heavy wheel boring mills, with cranes.

One tool grinder.

Two spindle arch bar drills.

One 2,000-pound steam hammer.

One 400-pound steam hammer.

The MacLean Pub. Co., Ltd.

Vol. VIII. DECEMBER, 1912 No. 12

A PHASE OF BUSINESS MANAGEMENT.

WISE and tactful administration of a business, be it large or small, and of whatever nature, is, as we all know, highly contributory to success in the broadest sense of the term, but while the director as well as the directed, step aside from or overstep the mark every once in a while, yet rarely, except on the eve of some pending "strike," do we hear of the former being publicly challenged for doing so.

It is not our intention to discuss here the general question of management, but rather to confine our observations to that phase of it which harasses a whole army of employes for the sins of omission, commission or incapacity of a few. There are men in every employ, scrupulous and high-principled, who resent being dubbed publicly as "black sheep," and who are not slow in many cases to say so. We speak from experience in this matter, and while the operation of the practice of harassment was in some instances more distasteful than in others, it nevertheless gave evidence, and will always do so, of a lamentable lack of wisdom and judgment on the administrator's part. Incapacity of an employe may induce or make it necessary for him to take all manner of abuse and impertinence from his superior, but that is no reason why the latter should spread himself and shower his vituperation broadcast. The error of it all seems to us to lie in the fact that incapacity is tolerated in employes for the display of management vanity. We have seen men herded and driven by every form of abuse, yet retained in the employ year after year, and, other than for the reason stated, we fail to see why, unless it be that their service is cheap and their output under the circumstances worth it.

Another feature of this question has got, however, to be accounted for, and the almost universal tendency to overlook it, not only creates discontent among employes of the right stamp, but interferes materially with their best efforts. As we have said, the innocent suffer with the guilty, and on account of, it may be, the smothered resentment aroused, these former, even in spite of themselves, debate the question of its being "worth while," thereby killing the "glory" aspect of their calling, and glorifying the pecuniary side unnecessarily. It may be urged, perhaps, that the "glory" feature of a man's profession or trade is somewhat of, or altogether a myth, but those who claim so, are lacking in and ignorant of the most essential qualification in men management. There are more employes who pride themselves on achievement than most of us imagine, and instead of trying to stifle this desirable attribute, it should be the earnest endeavor of every administrator to foster and increase it. As we have said, the inclusive attitude adopted or similarity of treatment meted out is the very antithesis of this, and neither makes for harmony, goodwill or ultimate business success. Some men, we are well aware, require driving, some need leading; others, however, will neither be driven or led, and management worthy the name and in superlative degree should discern these qualities in its servants and act and administer accordingly.

THE EDUCATIONAL TREND.

IN another part of this issue will be found an article entitled the "Education of Manual Workers," and who shall say that it does not contain much food for thought on the part of those who would lead and direct the educational side of the factory operative's nature. It will be noted that the writer's remarks are based on a wide variety of employment, and that the observations embrace numbers of employes running into hundreds of thousands.

In our November issue we dealt with the subject of technical education, and pointed out the ridiculously small percentage of those who really benefited by it. Mr. Dixon states that from 90 to 95 per cent. of manual workers need little more, from the educational standpoint, than the "three R's," and in this, as a result of his inquiries and investigations, he is backed by the practically unanimous opinion of those who direct our great industries. Men without an excess of education required for the pursuit of their calling, are, in the experience of all of us, much more contented, and were only a little more prominence given to the "dignity of labor," and a fuller realization had of the importance to our national welfare of the manual worker, fewer unseemly disputes would mark his relationship to capital.

We suggest to our readers the careful perusal of this article, and at the same time make intimation of our purpose to open the columns of our journal for an expression of views from those who care to give it on this interesting topic.

ACCIDENT PREVENTION.

IT is pleasing to note the earnestness of purpose with which our large employers of labor are prosecuting the development of means, methods and devices, whereby the accident record of our industries and enterprises may be reduced both in frequency and seriousness. The co-operation of the employe is, needless to say, the complement of their work, and that this will not be lacking, we are quite sure.

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

SELF-STARTER FOR AUTOMOBILE AND MOTOR BOAT ENGINES.

by W. M. Brown.

THE principal features and advantages of this device are its simplicity cheapness of construction and lightness. It provides a means whereby an automobile engine can be started from the driving seat, thereby eliminating all risks inseparable from the process of "cranking up." Fig. 1 shows a cross section of the mechanism and Fig. 2. is a side view. The various parts are similarly lettered in each view.

The starting lever (L) is fulcrumed to a side member of the frame;—see Fig. 1. Attached to it is a cable (H) which passes around the guide pulley (J) and the split pulley (B). This cable is fastened to the upper end of a lever (E). Attached to this lever at two points below the fulcrum is a steel band (E) fitted with fibre strips (D), as in a band brake. This surrounds a split drum (A) which grips the engine shaft (Z).

When the operator pulls on the starting lever (L) the first result is to pull over the lever (C) by means of the cable (H), thus firmly gripping the drum (A) by the band (E) and fibre pieces (D). Circular motion is then transmitted to the crankshaft of the engine by continued pressure being applied to the starting lever the whole mechanism revolving until the lever (C) strikes the knock-off block (O). This relieves the grip of the band on the drum (A), but by this time the engine will have been given sufficient compression to fire. The operator now pushes foward the starting lever to its original position, and the coil spring (P)—see Fig. 1, returns the pulley (B) back to its starting position with the stop block (M) resting on the rubber cushion (N). The spring (F) holds the fibre strips clear of the drum (A) when the engine is running.

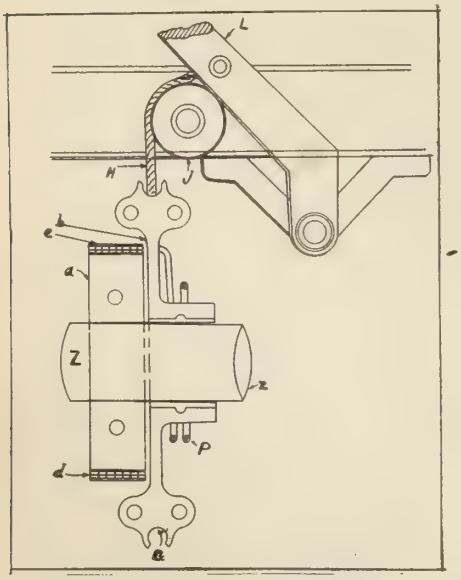

FIG. 1. SELF STARTER FOR AUTOMOBILES, ETC.

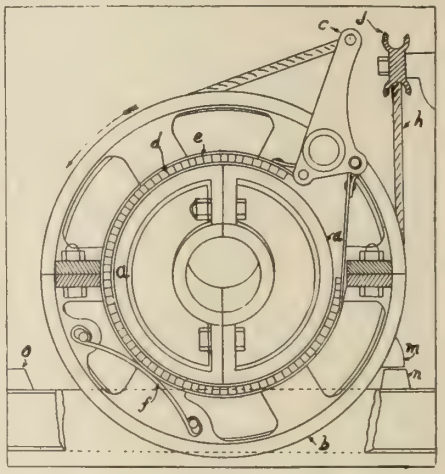

FIG. 2. SELF STARTER FOR AUTOMOBILES, ETC.

This self-starter is patented by Charles Hickling, Collingwood, Ont.

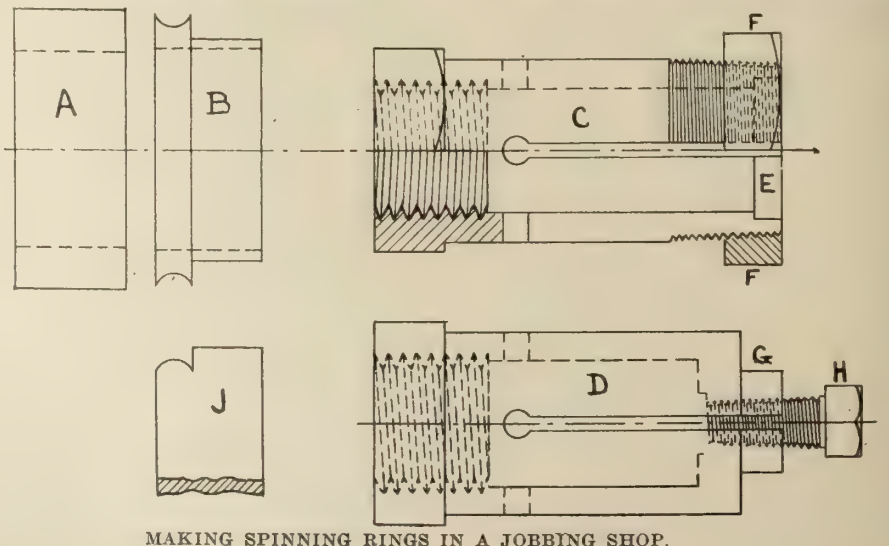
MAKING SPINNING RINGS IN A JOBBING SHOP.

By G. Barrett.

AT one time we received an order for 800 rings for ring spinning, and as considerable trouble was experienced in turning and boring them in the usual way, the writer devised the method herewith described and illustrated.

In filling the order, the first step was to have the blacksmith make the rings from 1 inch by ⅜ inch mild steel stock, as shown at (A). A finished ring is seen at (B). The rings were bored and turned with the aid of two cast-iron chucks, (C) and (D). Chuck (C) is made compressible and chuck (D) expansible by four saw cuts as shown. Both are screwed at one end to suit the lathe spindle. For boring, the rings are inserted in the recess (E) at end of chuck (C). This end of the chuck is screwed with a taper thread, so that by advancing the steel nut (F), the ring is firmly held. After boring, they are ready for turning on the chuck (D) which really forms an expanding mandrel. The rings are slipped on to the projection (G) and the mandrel is then expanded by the taper screw (H). Much time was saved and accuracy of outline assured by the use of the forming tool shown at (J). The slide rest also was fitted with a stop, thus allowing boy labor to be used without incurring the risk of any variation in the diameter of the rings.

NOTE.—In the cut, the chucks are not drawn to the same scale as the rings (A) and (B) and the forming tool (J).



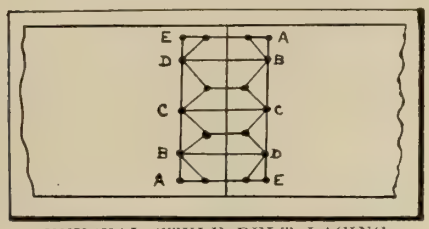
MAKING SPINNING RINGS IN A JOBBING SHOP.

BELT LACING.

By J. E. N.

THE recent article on styles of belt lacing reminds me of the unusual one here illustrated. Although a rather fancy affair, it is very serviceable. This lacing should only be used on belts over eight inches width, as it is too elaborate for small belts. However, after lacing

a few joints, it will be found possible to make this joint about as rapidly as the ordinary types. The unique feature of this lacing lies in its being the same on both sides of the belt. Since it con-



UNUSUAL STYLE BELT LACING.

tains angles and triangles many will claim that it is no good, and that all lacing should be straight on the pulley side. The designer himself made the foregoing remark to me; further stating that he had been lacing belts off and on for over twenty years and had never used a style giving better satisfaction than this one.

There are five holes at the back and only four at the front edge, which is directly opposite to the usual practice. The lacing is started at the centre and finished at E. on each side. Holes A, B, C, D, E, are laced once more, then if all the other holes are double laced the holes mentioned are laced three ply. It is said that when well hammered with a wooden mallet, the joint will run smoothly and outwear many straight-laced styles.

A CYLINDER PROBLEM.

By D. A. Hampson.

WE recently had occasion to use some cylinders of the sizes indicated in the drawing. It will be seen from Fig. 1 that each end carries a cored hub supported by a six arm spider and the first glance at the blue print made us shrink from the somewhat expensive pattern and core-box that seemed to be inevitably required. As there was little possibility of a second lot ever being made, the foundry foreman was consulted and he evolved a time (and labor) saving plan which is shown by the second figure. Instead of making the usual longitudinal divided pattern, a cylinder, 11½ and 13 in. x 9 in. long, Fig. 2, was constructed, and the spider, hub and six arms were built as a separate piece, and a sliding fit in the cylinder. The spider carried the core print for its hub.

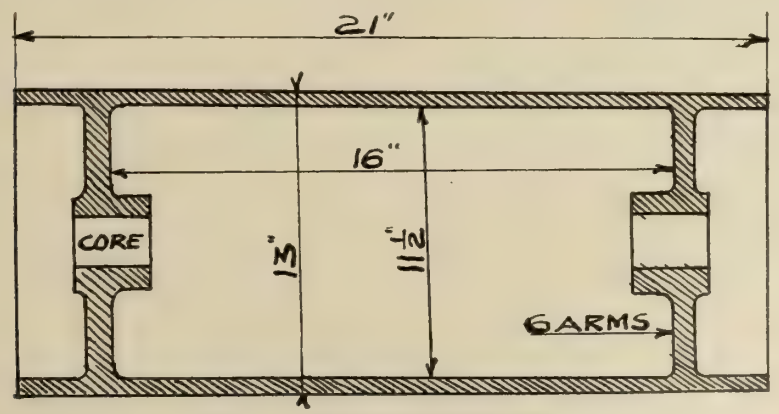


FIG. 1. A CYLINDER PROBLEM.

The piece was molded and poured on end. As shown, the spider and cylinder section were put in and rammed up. Then the cylinder, having been rapped sufficiently to withdraw it, was raised 6 inches, carefully straightened up and again rammed. This process was repeated, and at the correct spacing, the spider again inserted. An extra half inch of cylinder was added in the cope to turn off the poorest part of the iron.

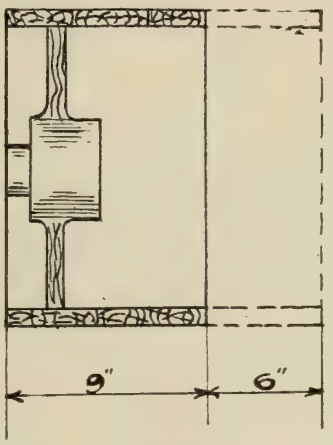

FIG. 2. A CYLINDER PROBLEM.

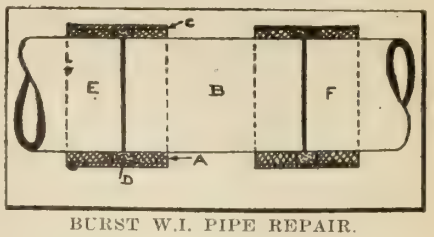
Our cylinders turned up perfectly clean, had little excess of stock to come off for straightening, and were well balanced. The patterns were made in a day's time and the general impression left by the job was most pleasing.

BURST WROUGHT IRON PIPE.

By Steamfitter.

LAST winter an engineer struck a snag. A wrought iron pipe 3 inches diameter froze up and burst. It was a cold water pipe in more ways than one before it was fixed, being in a place very difficult to reach. As it meant breaking a couple of walls to withdraw the length he used a hack saw and cut out the piece shown at B. He next cut another piece of good pipe, of equal length, and it be-



BURST W.I. PIPE REPAIR.

ing impossible to thread the ends E and F., the problem of how to make connection confronted him. Engineers as a rule are hard men to stick. He secured two 5-inch couplings, placed them over the two ends E and F, and ran them back far enough to get the new piece of threadless pipe B inserted. The couplings were then placed in the positions shown. Oakum was packed into the centres as shown at D and lead run into the ends as shown at A. After caulking up the latter firmly the water pressure (80 lbs. to the square inch), was turned on, and no trouble has been experienced since.

ELECTRICITY SUPPLY.

THE opening address by Mr. S. D. Schofield, read at Leeds before the Institution of Electrical Engineers, referred mainly to electricity supply.

One of the main points to be considered in the future, he said, would be the fixing of standard pressures and periodicities, and engineers interested in the manufacture of motors or incandescent lamps well knew what a boon this would be to them. The day of small supply stations was passing away, and if electrical energy was to be universally adopted for industrial purposes, at prices which would be profitable alike to the producer and the consumer, it could only be done with large generating units at stations where fuel could be obtained easily and cheaply, and where an abundant supply of water for condensing purposes was available. Generating stations which were put down to supply direct current, and for economic reasons were necessarily in the centre of a given area, would be dismantled and utilized as sub-stations, taking current in bulk from a large central station. The question as to whether these large stations would be controlled by companies or by groups of local authorities would settle itself in the future.

Electrical Engineering Activity.

At no time in the history of electrical engineering was there such a marked activity in all its branches as there was

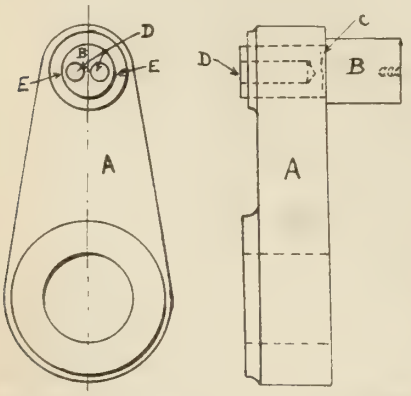
to-day. The textile manufacturers had found out how their interests were best served, and apparently were adopting the electric drive as quickly as it could be installed. The advantages of electricity for heating and cooking were being realized, and if the new demand was properly developed, it would mean not only an increase in the quantity of apparatus in use, but also new and heavier mains, and additional generating units.

One result of the excellent plant now provided for electricity generation and distribution was a tendency on the part of engineers to become stereotyped in their methods, and in too many cases to refuse new business because it did not fall in with "red tape" conditions. Supply engineers should be always open for business, if there was a margin on the right side in it, even if it compelled them temporarily to overload the plant and mains. To-day, with the first-class plant available and with standardization, there was a tendency to practice caution until it ceased to be a virtue.

EXTRACTING FRACTURED CRANK PINS.

By Alfred V. Begbie.

IN the drawing, A represents the crank arm and B the crank fractured at C. To remove the pin, two holes (D) are drilled with the aid of a ratchet or some easier method. These holes should be of such size as to remove as much metal



EXTRACTING FRACTURED CRANK PINS.

across the diameter of the pin as possible, without endangering the hole in the crank arm, and of depth to come short of the fracture. The web between the two holes is next cut through with a chisel, and if necessary to still further weaken the pin, a round nose chisel may be used to thin down the walls between the holes D and the hole in the crank arm at EE. By placing a steel bar in one of the holes D and with a good husky man at the end of a sledge handle and a suitable block on the face of the crank, the offending pin is usually easy to drive out.

PRIME MOVER CENSUS IN U.S.A.

FIGURES of the power census in the United States in 1909 have been published. Renting electric power is rapidly increasing. Gas engines are used largely in certain parts where there are gas wells. Water wheels are used most largely in New England, but even there, constitute one-fourth of the total power. The percentage division of the 1909 total is:—Steam, 76.0; gas, 4.0; water wheels, 9.7; water motors, 0.1; others, 0.2.

Primary power.	Number of engines. 1909.	1904.	Horse-power. 1909.	1904.
Total	408,472	231,363	18,680,776	13,487,707
Steam	153,482	127,267	14,202,137	10,825,348
Gas	34,352	21,515	754,083	289,423
Water wheels	20,126	19,595	1,807,144	1,641,949
Water motors	1,203	1,397	15,449	5,931
Other	....	....	29,293	92,154

INTERESTING APPLICATION OF AUTOGENOUS WELDING.

AN interesting application of oxy-acetylene welding for correcting an error made in a machine shop is here shown. The gear wheel seen in the illustration is about 4 feet in diameter and weighs approximately 1,000 pounds. This gear had 23 teeth cut. After ten teeth had been cut the full size, the index of the machine was accidentally moved and the 11th tooth was cut half a size too small. The machine operator then adjusted the index properly and cut the other 12 teeth, which, of course, were out of position on account of the 11th tooth being too small.

Under other circumstances this casting would have had to be thrown upon the scrap heap; but by utilizing the process of autogenous welding, this waste was avoided and the casting saved. The method of making the alteration is pretty clearly shown in the photograph. The section showing the first 10 teeth cut out, as seen in the illustration, was replaced with the aid of a templet, in such manner as to bring all the teeth into correct alignment. The piece was then clamped firmly to the casting, the oxy-acetylene flame applied, and the piece welded so that it was quite as good as new. Thus instead of recutting all the teeth, only two had to be re-cut—one at each end of the welded section.

The cost of the casting, including the work done previous to welding, was about $45.00. The welding process cost $30.00, thus showing a direct saving of about $15.00 and an indirect saving very much greater; because the blank was made good within 24 hours after the mistake happened, whereas, had it been thrown on the scrap heap, not only would the work have been lost, but a considerable delay would have ensued before a new casting could be obtained. This is only one of the many ways in which the oxy-acetylene process can be brought to the direct aid of machine shops to save them time and money and incidentally

AN INTERESTING APPLICATION OF AUTOGENOUS WELDING.

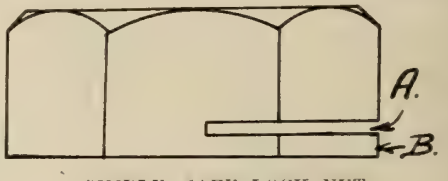
their reputation for good work; as for instance, when mistakes of the above description happen.

We are indebted to the Franco-Canadian Welding Co., 331 Yonge St., Toronto, for the above particulars, and the photograph from which our cut was made.

SIMPLE SAFE LOCK NUT.

By U. M.

TO make a nut that will never get loose by vibration, cut a slot in it with a hacksaw as at A, before threading. With a cold chisel as a wedge,



SIMPLE, SAFE LOCK NUT.

force the piece B. down a little. Now thread the nut, apply and tighten up in place, and no lock nut will be necessary.

New Hamburg, Ont.—The Electrical Utilities Co., Toronto, Ont., has its new buildings at New Hamburg, Ont., nearly completed. The plant will include a brass foundry, iron foundry, machine shop, electro-plating and woodworking departments. Complete equipment will be required. James Fowler is president, and R. F. Smith, secretary.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

NEW JAR-RAM ROLLOVER AND PATTERN DRAWING MACHINE.

THE jarring moulding machine, with an independent rollover and pattern drawing device, shown in the accompanying illustrations, has just been placed on the market by The Herman Pneumatic Machine Company, of Zelienople, Pa. The purpose of a machine of this character is to give a good rollover action and a perfect pattern draw. The machine is operated entirely by compressed air. Fig. 1 shows jarring machine to be independent from the rollover device. The connecting arms that extend from the rollover mechanism, engage trunnions on the rollover plate, which rests on the jarring machine. The pattern and flask are secured to the rollover plate.

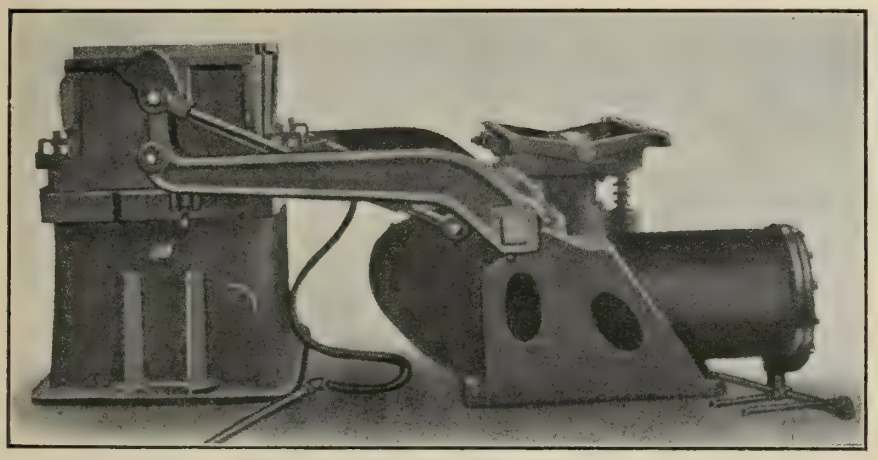


FIG. 1. THE MACHINE IN POSITION FOR JAR-RAMMING THE MOULD.

While the jarring operation is taking place, the side rollover arms remain stationary. Then, after the mould has been jarred, air is applied to the rollover cylinder, which causes the rollover plate together with the flask to rise, when the lifting arms engage the rollover plate. The rollover action is accomplished by a small arm which is connected to the trunnion on the rollover plate and the fixed centres of the base of the rollover device. These centres, being somewhat shorter than those on the large arm, cause a rotating movement to the rollover plate as shown in Fig. 2. This rotating action continues until the stop on the rollover plate trunnion comes in contact with the equalizing and levelling device on the large rollover arm, which gradually brings the flask and rollover plate to rest, as shown in Fig. 3. Air is now admitted to the pattern drawing cylinder, the upper part of the ram of which is attached to the equalizing device used for taking up irregularities on the bottom board.

This pattern drawing cylinder rises until it meets the flask. The clamps are then removed and as the rollover plate is held in a firm position, the vibrator attached to the rollover plate is started and the air, exhausting from the pattern drawing cylinder, allows the plunger to descend as shown in Fig. 4. By exhausting the air from the rollover cylinder, the rollover plate with pattern is returned to its position, as shown in Fig. 5. Fig. 2 shows clearly that the rollover device has no connection whatever with the jarring feature; so that it remains serviceable for a longer time than it would ordinarily do if it were connected directly with the machine; moreover, the pattern is thus drawn more accurately.

The machine shown has a table of 30x45 in. and a lifting capacity of 5,000 lbs., while the rollover device has a capacity of 4000 lbs. The machine above described has an automatic, self contained control valve, attached to the jarring machine, which regulates itself automatically to the different loads it is required to lift. This valve is of the differential type and is entirely closed. Its operation does not depend on any external or exposed operating parts.

In the rollover device all moving parts are bronze bushed or babbitted and provided with adjustment for wear. The journals are provided with efficient oiling devices and are thoroughly protected with dust guards. The arms are made from vanadium steel castings and forgings. The rollover and pattern drawing cylinders are cast in one piece, thus ensuring that they will always maintain their correct relative positions, which is an important essential in this machine. The pistons are fitted with accurately ground lap joint packing rings; and both cylinders have properly designed cushioning devices which eliminate any possibility of breakage through careless handling. The equalizing device for taking up irregularities in the bottom board consists of a very simple arrangement of steel beams hung on one centre to allow of movement in all directions. The makers claim special advantages for the semi-elliptical springs seen in the cuts, Fig. 3 and 4. These are for the purpose

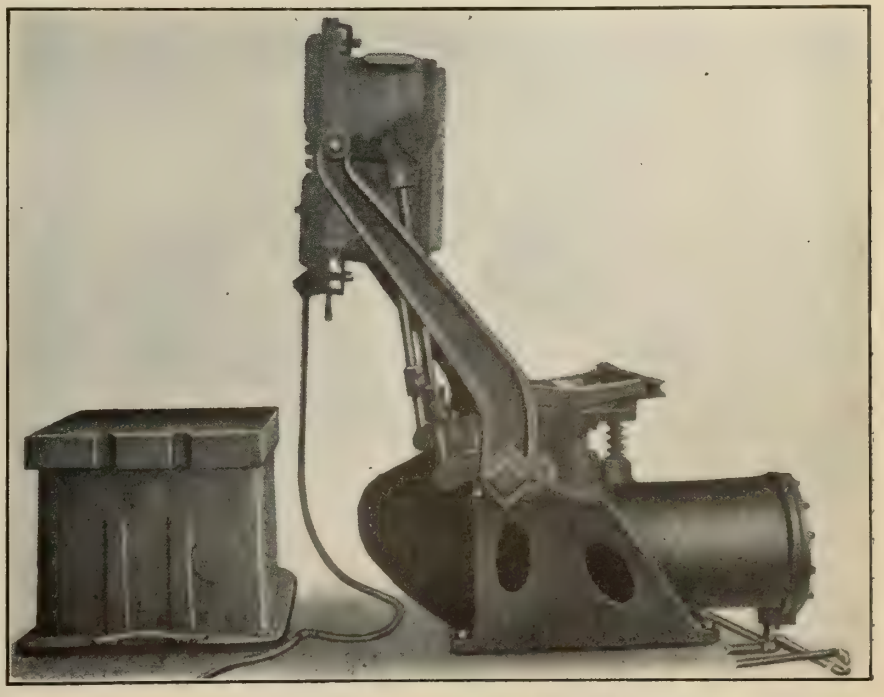

FIG. 2. THE MOULD BEING ROLLED OVER AFTER RAMMING.

of locking the equalizing device after it is pressed against the bottom board by the action of the pattern drawing cylinder. This method locks the equalizing device tight enough to prevent all danger of its shifting from the weight of the flask, once it is set.

This machine was exhibited at the Foundrymen's Convention, Buffalo, in September last and aroused a great deal of interest.

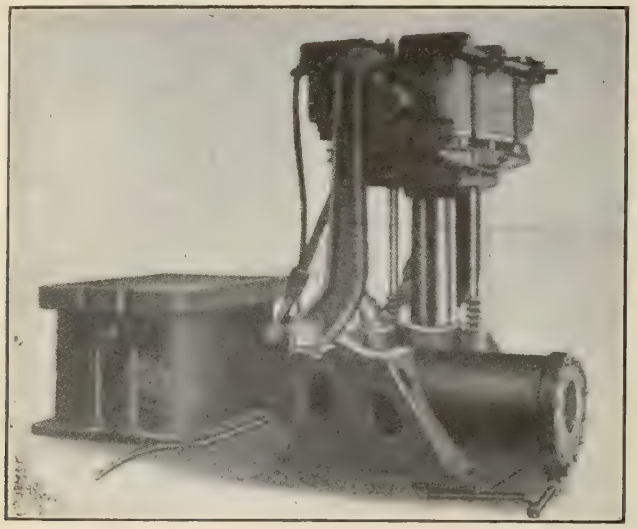

FIG. 3. MOULD ROLLED OVER. PATTERN ABOUT TO BE DRAWN.

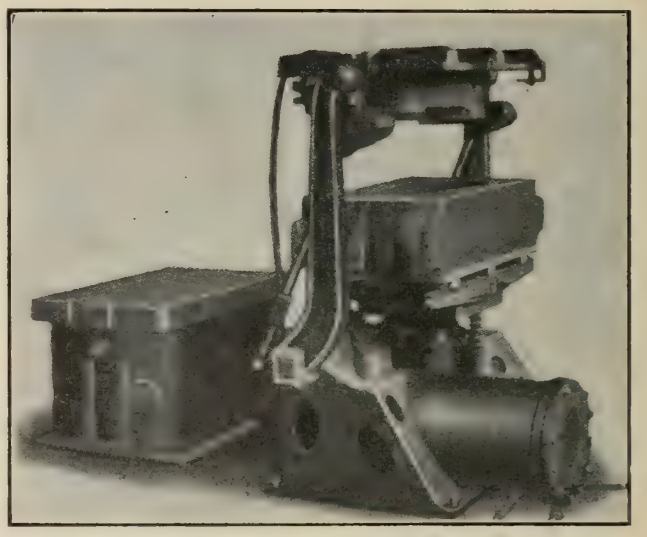

FIG. 4. THE PATTERN DRAWN.

A NEW HACKSAW BLADE.

THERE has recently been placed upon the market a double action hacksaw blade, the invention of Mr. Alex. Reitlinger, 201 William Street, New York City, who has sent us a sample 8-inch saw for inspection. In this saw, the teeth face in both directions in alternate groups of four; that is to say, four teeth face one way and the next four the opposite way, and so on. The blade thus cuts on both strokes, with a corresponding saving of time over the usual type. When used in a hand frame, it is claimed that the double action saw is easier on the operator, while in a power frame it can be reversed when one set of teeth become dull, thus practically cutting the cost of blades in half.

We are informed that exhaustive tests have been made with these saws in competition with saws of other makes and that they have been found to reduce the time necessary to cut a given piece of metal by 30 to 50 per cent.

ELECTRICALLY DRIVEN COGGING MILL.

IT may be of interest to those contemplating the installation of electrical drives in rolling mills to hear that the electrically operated 28-in. reversing cogging mill at Messrs. Dorman Long & Co.'s Britannia Works, Middlesbrough, England, which was laid down by the British Thomson-Houston Co., of Rugby, in 1909, is operating to the entire satisfaction of the management.

The electrical equipment consists of a mill motor of 1,200-3,600 h.p., at 70-120 r.p.m., directly connected to the rolls, and supplied with continuous current at 0-440 volts by a flywheel equalizer set. This motor is fed from a 2,750-volt, 40-cycle, 3-phase supply, and is mounted on the same base-plate as, and directly coupled to, a generator rated at 1,000-3,000 kw. The speed of the set is 480 r.p.m., and the flywheel, which weighs 33 tons, and is 11 ft. in diameter, runs in its own bearings, and is connected to the generator by a special compression type flexible coupling.

The plant has proved itself capable of outputs considerably in excess of the makers' guarantees, and in practice, the mill motor is subject to overloads much higher than the maximum rating given above. It has not been found necessary to give any special attention to the commutators of the continuous current machines in order to ensure satisfactory operation. That of the mill motor has not been ground or trued up in any way since its installation, and the commutation of the generator is sparkless, although more than two years have elapsed since the commutator was ground up.

EXTRA HEAVY DUTY BALL BEARING.

THE Chapman Double Ball Bearing Company of Canada, Ltd., Sorauren Avenue, Toronto, have just added to their regular line a new type of ball bearing specially suited for heavy duty transmission work. These bearings are regularly made in all sizes from 1 7-16 inches to 6 inches diameter inclusive, the one herewith illustrated being of the latter size. This is probably the largest standard bearing regularly manufactur-

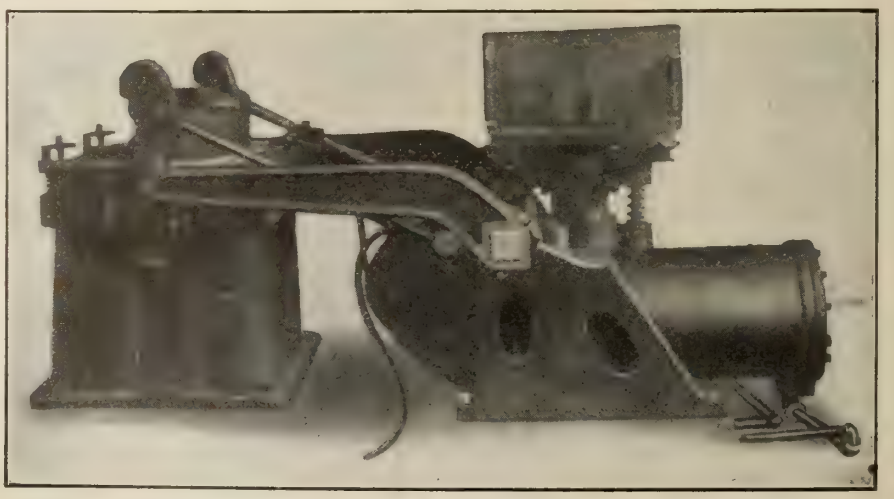

FIG. 5. THE MOULD READY TO BE REMOVED. THE PATTERN HAS BEEN RETURNED TO TABLE OF THE JAR-RAMMING MACHINE BY THE ROLL-OVER ARMS.

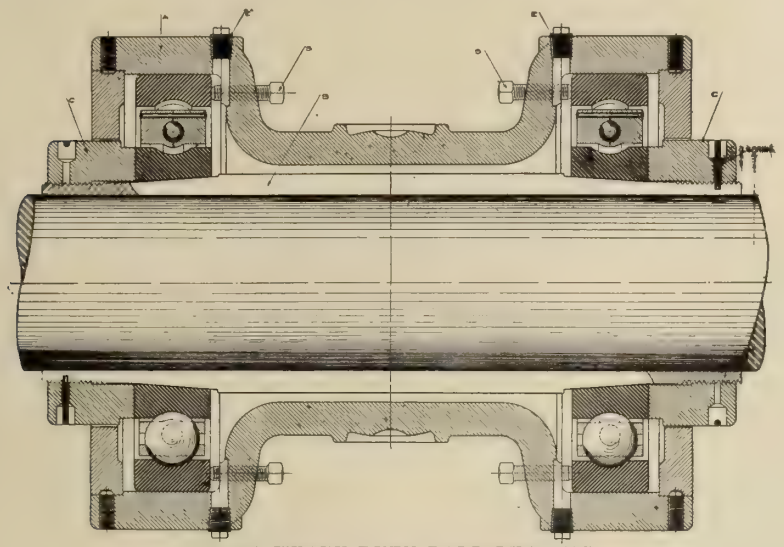
ed by any company for transmission purposes.

As may be seen from the illustration, the bearing is of the double annular type, the large balls being 1⅞ inches diameter, and the smaller intermediate balls 11-16 inch diameter. The ball races are of best chrome vanadium steel, the



EXTRA HEAVY DUTY BALL BEARING.

cages being phosphor bronze. The sleeve (B) is made from a steel casting split partly through into six segments to allow of its being securely clamped upon the shaft by the heavy cast-iron nuts or collars (C). These collars are threaded with an Acme thread and securely locked by means of C-springs. Sufficient adjustment is provided to allow the bearing to be properly fitted to shafts varying from .005-inch oversize to .005-inch undersize. The housing is made specially heavy to give the races ample support and prevent their deformation under load. The lubricant (vaseline) is retained by the end caps seen in the cut. These bearings are designed to fit any standard type of hanger. The 6-inch bearing here shown weighs approximately 650 pounds.

In manufacturing work of this class it will of course be understood that a very high degree of accuracy is absolutely necessary. The ball races are hardened and afterwards ground on special machines which ensure absolute uniformity. In making the cages, special jigs and fixtures are used to ensure correct relationship between the large and the small balls. The balls themselves are imported from Europe under a guarantee that each one is accurate to .0001 inch; but even with this guarantee, every ball, no matter what its size, is micrometered and tested on receipt.

When installing these bearings they are slipped on the shaft and then placed in their hangers. After the shaft is coupled up, aligned and leveled, the collars (C) are screwed up until the sleeve (B) is tight on the shaft. The set screws (S) are for the purpose of preventing the bearing, when being placed on the shaft, from sliding on the sleeve and causing the latter to collapse. When the bearing is in place, and before the sleeve is clamped to the shaft by the collars (C), the set screws are slackened back about ¼ inch clear of the ball races.

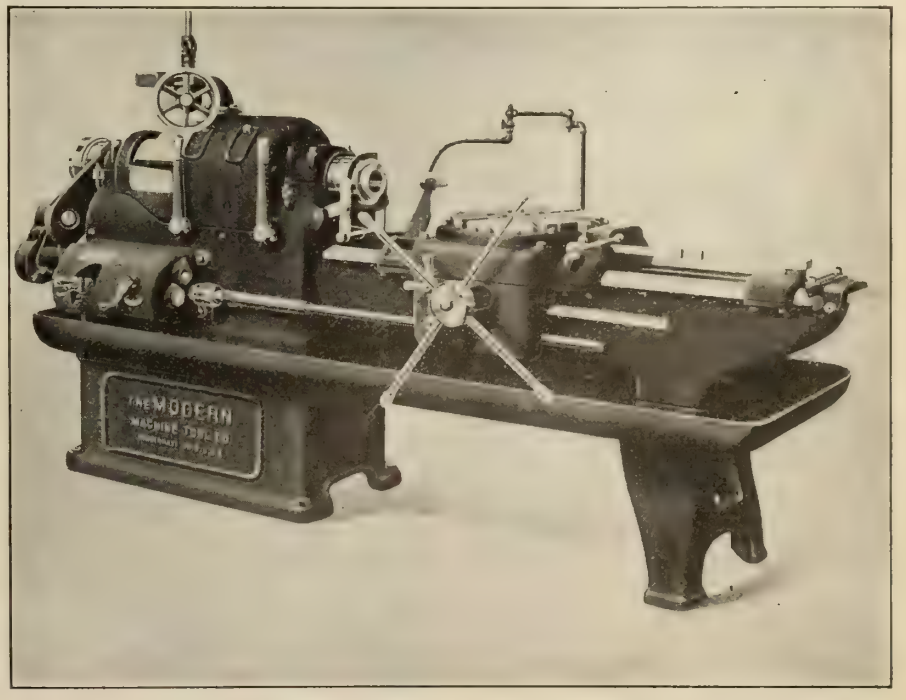
The Chapman Double Ball Bearing Co. has recently shipped to the Mississquoi Marble Co., Phillipsburg, Que., a complete transmission equipment, including six of these large bearings. Two of them are to take the pull of a 47-inch, 3-ply leather belt transmitting 360 horsepower. The main line shaft is 360 feet in length and reduces in size from 5 15-16 inches to 4 7-16 inches.

Another order now being shipped calls for 413 bearings of sizes varying from 2 5-16 inches to 4 7-16 inches, for the St. Maurice Valley Cotton Co., Three Rivers, Que. This is the third mill belonging to the same syndicate which has been so equipped, the other two being the Wabasso Cotton Co., Three Rivers, and the Shawinigan Falls Knitting Co., Shawinigan Falls.

NEW FLAT TURRET LATHE.

THE Modern Machine Tool Co., Cincinnati, Ohio, is now building and putting on the market a new flat turret lathe, made from entirely new designs, massive in detail, and embracing all the features of the best and most modern forms of lathe construction. Careful attention has been given to the arrangement of its various parts, so as to secure ease of manipulation, compactness and simplicity; each part being designed so as to be commensurate with the strains to which it is subjected. The machine affords that rigidity necessary to the elimination of vibration, an important requisite in the production of accurate work and perfect surfaces.

The "Modern" is built with all of its parts extra heavy so that it is capable of handling a gang of tools of extra size and taking extra heavy cuts with ease. It is, nevertheless, easy to handle, and convenient in every detail for the operator; every handle, lever and wheel being at the operator's finger ends. Every adjustment is easily made, and every inducement offered the operator to pro-



NEW FLAT TURRET LATHE.

duce the most and best work there is in him.

The construction and extra size of parts and bearings give increased strength and additional weight in those sections usually made too light to withstand the duty required at high speeds, and the exceptionally severe strains caused by the use of high speed steel when taking heavy cuts.

The accompanying illustrations indicate the many attractive features of the lathe, and show at a glance the massiveness of the head and bed, as well as general construction. The head contains the cone pulley for driving the machine, the friction back gears and the automatic roller feed and chuck. The cone and gears give the machine twelve spindle speeds in exact geometric progression, ranging from 24 to 465 r.p.m. The bed rests on a three point bearing, is extremely deep and heavy, and crescent-shape formed and reinforced under the front spindle bearing.

This machine is manufactured on the unit system of construction, eliminating, to an appreciable extent, individual fitting in the assembling, and insuring interchangeability of parts. Plain bearings are scraped to master surface plates and straight edges, shaft bearings are ground and fitted with suitable removable bushings, which may be replaced when worn without disturbing the alignment of the shafts, while all sliding surfaces and revolving parts are provided with liberal and efficient means of lubrication readily accessible. The belt shifter is operated by the hand wheel in front of the head within easy reach of the operator, and the motion from the hand wheel is transmitted to the belt loop through an intermittent rack and pinion. A similar device is suspended from the countershaft and operates in unison with the device on the head through the knuckle joints and connecting rod, as shown. The belt loops are so timed, that a half a turn of the hand wheel to the left shifts the belt from the larger step to the smaller step on the head, while the loop on the upper device holds the belt out of contact with the edges of the cone on the countershaft. The next half turn of the hand wheel moves the upper loop in line with the corresponding cone on the countershaft. Thus, it will be seen that one turn of the hand wheel shifts the belt from step to step in either direction.

The automatic chuck is operated by a single movement of a lever in front of the head. It has a strong and unyielding grip, no overhang, no end motion, no changing of the jaws. One set of jaws is adjustable for the full capacity of the machine. The jaws and seat are hardened and ground. This chuck is constructed for handling rough bars. The jaws are of unbreakable form and may be readily made for any size and shape within the spindle's capacity.

The feed gear box is driven from the spindle. Eight feeds are obtainable instantly, ranging from .005 to .085 per revolution of spindle and may be operated in either direction. These feed changes are obtained by means of the lever and crank handle shown at the front of the gear box. Motion from the feed box is transmitted through a disc friction and knuckle joint, through the carriage feed rod. The gears, cone pulley and all moving parts are enclosed to prevent injury to the operator.

The turret is 18 inches diameter, provided with (T) slots of ample proportions, thus permitting the use of substantial planer head bolts for securing the turning tools to the turret. These can be secured, one back of another, for turning several diameters at one movement of the turret, thus eliminating the objectionable stud-bolt. The index is large in diameter, the lock bolt located directly under the working tool, and so close to it, that there can be no lost motion between the tool and the locking pin.

The triple friction countershaft has pulleys 16 inches diameter for 4½-inch belt. The cone has three steps, the largest diameter being 14½ inches, carrying a 4-inch double belt. The net weight of the machine is 4,500 pounds, and the floor space 4 x 11 feet.

MOULDING A JACKETTED GAS ENGINE CYLINDER.

IN the course of a paper on "The Moulding of a Jacketted Gas Engine Cylinder," given before the Sheffield branch of the British Foundrymen's Association on October 26th, Mr. J. G. Robinson, of Halifax, advocated the use of chills in making a cylinder to avoid drawn or spongy places in the casting caused by the variations in its thickness. Chills, he said, were introduced in order to close the grain of the metal and to obtain an even rate of cooling of the thick and thin parts alike. The old-fashioned foundrymen were afraid of chills, lest they should produce hard white iron and cause trouble in the machine shop; but by the judicious use of chills and a knowledge of the correct thickness to use, it was possible to obtain the effect desired. Owing to carelessness the coremakers, sometimes did not get the chills to follow one another in a circle, but if they were placed truly there should be no trouble in boring.

It was possible to get metal so hot that the mould could not stand it. The hotter, however, the metal, the more solid would be the casting. At the same time, he did not believe in casting everything as hot as the metal could be brought from the cupola. He had never known any oil-sand really to blow, and he agreed that better results were obtainable from raw than from boiled oil. The latter seemed to separate out on to the skin of the core, and produced a harder skin than did the raw material, and metal would not lie quietly on a hard surface. There was no question, however, about the saving of cost by using the boiled oil; on the class of work he had been describing, the cost of coremaking was reduced at least 30 per cent., and fettling from 75 to 100 per cent. There was nothing better than raw linseed oil, but when they considered the cost they realized that it was not merely a case of using the best material.

EFFECTS OF REPEATED MELTING

TO ascertain the extent to which repeated melting influences the strength and reliability of bearing metals, an investigation was made by the German official testing bureau for materials, with the following results:—Alloys of copper, antimony, and tin were not appreciably affected by repeated meltings, but the rate of cooling was an important factor. Quick cooling yielded a finer grain and higher hardness and strength, and as a result it is recommended that white metals should not be heated to high temperatures, but should be cooled rapidly. Bronze, poor in tin, and therefore, comparatively inexpensive, may have the hardness and strength increased by being rapidly cooled from a temperature of 1440 deg. Fah.

NICKEL IN CANADA.

IT is claimed that Canada possesses the key to the European naval problem," states a report. "When Schneider in 1889 introduced the use of nickel into the manufacture of steel armor plates he little realized that he was placing in Canada's hands a great means for maintaining the peace of the world. Battleships without nickel steel armor would be utterly helpless before modern guns. If nickel were no longer obtainable, armor construction would go back a quarter of a century.

Canada to-day produces about 90 per cent. of the world's supply of nickel, and practically all of the remainder comes from New Caledonia, an island in the southwestern Pacific controlled by France. In 1910 the value of nickel ore and matter exported from Canada to the United States was approximately $3,450,000. As the only refineries in America are in the United States, nearly six-sevenths of the Canadian nickel was refined to the south of the border. Consequently, if Canada were to prohibit the export of nickel, the nickel steel industries of Europe would fall into decay and high grade armor plate for battleships would be an impossibility.

C.N.R. CAR WHEEL PLANT.

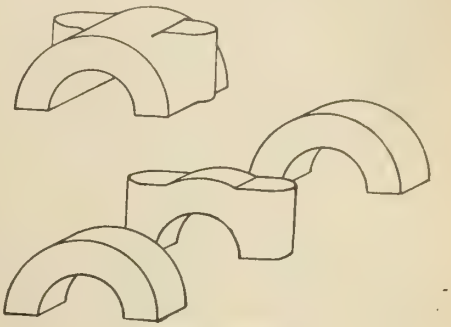
We understand that the Canadian Northern Railway are planning the erection of a Car Wheel Plant in Toronto, and that Mr. J. Kilpatrick, who recently resigned his position as general superintendent of the Canada Iron Corporation, is in charge of the project.

Alfred Weeks, Johnstown, P., has been appointed chief mechanical engineer of the Canadian & Northwestern Steel Co., Vancouver, B.C. Mr. Weeks graduated from the mechanical departmen of the Western Universiay of Pennsylvania, Pittsburg, in 1904, and later worked for the Cambria Steel Co., Johnstown, Pa.

THE BUSINESS OF PATTERNMAKING.*

By James Glass, Pittsfield, Mass.

TO build correctly and quickly, which means cheaply, is a commercial necessity. The general lack of the constructive quality in workmen is best



FIGS. 1 AND 2.

known to the progressive employer, whether in the foundry or in any other industrial line of action. Nowhere in manufacturing is its influence felt and its usefulness more applicable than in the patternshop.

Pattern Construction.

Until recent years the patternshop has been looked upon as a semi-productive department and the patternmaker as a kind of a half brother to the artist. This attitude of the employer no doubt has brought about the present condition with its lack of individual improvement, and certainly has curtailed the patternmaker's value as a productive unit. To get at something that will be mutually beneficial to employer and employee alike we must replace the artist by the mechanic, the impractical with the practical, the

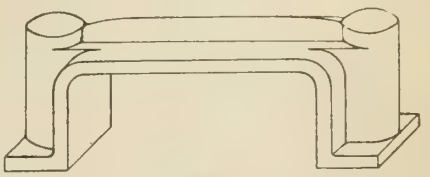


FIG. 3.

aesthetic with the constructive. Let us look along the benches in the patternshop. We find the boy or the man laboring over a drawing. He has formed correct impressions as to the general outline of the work. He has concluded as to the best method of molding, but the construction of the pattern has him guessing. This stay in the progress of oper-

*Abstract of paper read at the recent Foundrymen's Convention in Buffalo, N.Y.

ation does not always apply to a big job but very often to the small one, and the mode of construction is the determining factor in the price. How often have we heard the patternmaker say, "If I had to make that job again I would build it a different and an easier way;" but unfortunately for the employer the same design is seldom used.

I say the mode of construction on a small pattern regulates the cost, and let me give a few simple illustrations in defense of the assertion. Take a small cap as in Fig. 1. Nine times out of ten the man will lay it out on a small block, saw out what he can on the band saw, and then complete the work carving it out to the desired shape by hand. By constructing it as in Fig. 2 we take full advantage of the saw, reducing hand work to a minimum and saving at least fifty per cent. in cost.

Take another small pattern as in Fig. 3. To lay this pattern out on a piece of wood and dig out by hand what cannot be reached with the saw means labor and time; but note in Fig. 4 how near to completion it can be got by dissecting it and doing the work almost wholly with the machine. The dissecting of a small pattern to facilitate its production does not always weaken it, as some might think, but as a matter of fact more often strengthens it, and for the majority of purposes quality of workmanship is not destroyed.

In a bigger pattern, such as an ordinary bedplate, for molding purposes, durability, etc., we have decided to make a box pattern, coring out the inside. The usual mode of procedure on a pattern like this is to get out two frames (top and bottom) to the given dimensions, half lapping them at the corners, and filling in between to the desired shape and height. Fig. 5 shows how in building we may form an enlarged lap with butt joints, simplifying construction and with a noticeable saving in labor. By glueing blocks in the corners and pieces across the joints inside while building, we have a pattern capable of withstanding any kind of abuse.

The constructive man.

These illustrations are elementary to some patternmakers, but the general need of attention along these lines is very obvious to those directly connected with the trade. I have talked of the man who makes every lick count, "the man who makes a good piece of work" with a hundred per cent. less time on it than the other men in the shop, and with seemingly less effort—he's the constructive man. This is the man we are all looking for; the kind of a workman we want to raise. This is the man who does not have to be told every move to make, who increases production and decreases the cost of supervision. In him we have the evolution of the artist in the patternshop—the builder. He is the type of workman who is always respected by the boss and admired by his fellow workmen—respected

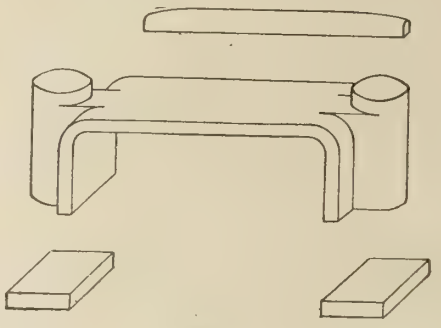

FIG. 4.

by the broad-minded foreman because of his rapid completion of the work entrusted to him, and admired by the men because he is a leader; but it is surprising how few realize and how seldom the attention is drawn to the fact that this man's master power is due to his natural or acquired constructive ability. It is oftener concluded that his qualities originated in his having worked in many good shops; yet, while moving around is

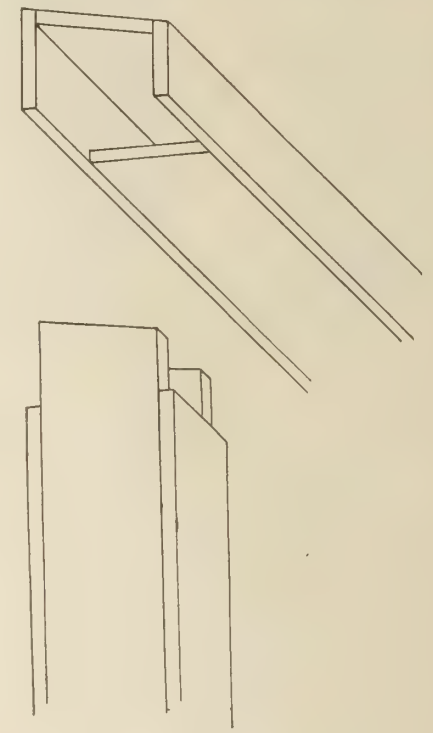

FIG. 5.

a help to the builder, adding to his confidence in generalities, it is far from being the key to his success as a workman. Some men might chase from shop to shop for a hundred years and never climb above the ordinary.

Some years ago, while working in the patternshop connected with one of our large plants, I wanted to confer with the foreman as to the method of building up a good-sized pattern and approached him with this purpose in view, but met with the response, "If you are a patternmaker you ought to know." It was this indifferent attitude of one whose position warrants assistance rather than rebuff that made me seek the society of Mr. Construction, and believe me he is the most willing and most able consulting engineer of my associates.

"The art of patternmaking!" Why, art is a disguise to talent, taste is the foundation of art, constructivity is a creation of the mind, a ramification of thought. We take our place in the industrial field according to our constructive ability—nations, as well as individuals. Jas. Naysmith, through his study of Euclid (mathematics) developed his steam hammer. The foundryman's success is due to an efficient business structure; the scientist's achievements to synthetic atomic and molecular work on stable and unstable compounds.

The Patternmakers' Outlook.

The patternmaker is apt to be looked upon by the manufacturer as artistic—a kind of a luxury; yet the patternmaker of the future must and is going to have a different place in the industrial arena. With a constructive training, his opportunities for promotion never were brighter, for through specialization in the other departments, the sources from whence the bigger men were drawn have been partially destroyed, and the employer will look more to the patternshop for this supply. Some patternmakers are alive to this fact and are preparing themselves for it, as is very evident from the number we see as foundry foremen, superintendents and incumbents of other responsible positions. The manufacturer is giving every indication of encouragement. He is taking him out of cellars and attics and providing him with comfortable quarters, he is organizing industrial schools for his benefit, he is saying to the patternmaker—"there is the foundation—build." Constructivity, when the seeds are properly planted, is both interesting and fascinating. It teaches resourcefulness and is a developer of originality. It attracts and it leads, and is a pleasurable means to a profitable end.

Should you find your pattern production lagging and are at a loss how to stimulate activity, before applying the megaphone method, thereby spreading a discordant feeling among the men, ascertain if a decided change cannot be made in the mode of "construction."

IRON AND STEEL PLANT, ST. JOHN, N.B.

THE proposed iron and steel plant and other developments for the city of St. John came in for discussion at a recent meeting of the Provincial Government, when requests were made for Government assistance in carrying the projects to a successful issue. Messrs. W. H. Thorne, president of the Imperial Dry Dock Company, and W. Burton Stewart and J. R. Stone, directors, were present at the meeting, and told of the proposed development. Mr. Stewart spoke at length on the importance of the iron and steel plant to the city of St. John and the province generally. He asked that the government, with the city of St. John, guarantee the amount of the sinking fund for the redemption of the bonds, should the annual earnings of the company be not sufficient to put aside one per cent. for such purpose.

The government gave the members of the Dry Dock Company assurance that their requests would be considered as early as possible.

At the conclusion of the conference, Mr. Stewart, who is the general manager of the Norton Griffiths Co., expressed himself as highly pleased with the reception tendered the delegation by the members of the Government. The object of the assistance from the city of St. John and the government, he said, was to enable the company to secure a site for the iron and steel plant, which would involve an expenditure of between two and three thousand dollars in its establishment and would afford employment to between a thousand and two thousand men. The company would require to put aside $48,000 a year towards a sinking fund.

Before taking definite action in the matter it is expected that the government will meet with the city commisioners of St. John relative to the matter.

CANADIAN CAR & FOUNDRY CO.

THE report of the year's operations to September 30 last, which will be presented at the annual meeting of the shareholders of the Canadian Car & Foundry Co., on December 12, is understood to be very favorable. The last annual report showed net profits of $1,007,138, from which were deducted $385,000 for preferred dividends, leaving a balance of $622,138 available on the $3,875,000 of common stock equivalent to 16 per cent., and from which a dividend of 4 per cent. was declared.

At the close of the fiscal year September 30, 1911, the unfilled orders on the books of the company amounted to over $5,000,000; on November 30, 1911, they were approximately $10,000,000, but on account of the severe depression in the United States, and resulting competition for Canadian business, many of these orders had to be taken up at rock bottom prices, so that profits on this year's operations will be curtailed although offset by the larger volume of business.

18 Per Cent. on Common.

"The amount that will be shown for the year 1912," says the Financial Times, "can be stated on good authority to be in the neighborhood of 18 per cent. on the common stock, after providing for interest, preferred dividends and liberal appropriations. The fixed charges are increased by the addition of $1,100,000 six per cent. bonds issued recently to finance additional plants and extensions.

"The management, having announced that it intended to pursue a conservative policy by strengthening the reserve funds, declined last year to accept the suggestion of some shareholders that quarterly dividends be paid instead of semi-annually, and adhered to the policy of declaring the amount of dividends to be paid on the common shares after the year's net results are known. In view of the large amount of construction being done by the company to cope with the ever growing demand for equipment, and to offer effective competition to the numerous car companies formed this year, it is generally understood that no change from the half-yearly payments of two per cent. will be declared at the coming meeting, nor is any increase expected during the early part of the new fiscal year."

PIECE WORK.

Mr. T. F. Keane, in speaking before the Master Blacksmiths' Association recently, dealt with the advantages of piece work over day labor. He said: "With piece work a man's ability is accurately known. The men will not only apply all their skill in doing the work, but they will improve their output and learn better and more efficient methods of handling their tools, so that they may work them up to greater capacity. The output can be increased and also better work turned out if the same kind of work is always given to the same man, as men constantly employed on the same kind of work will become more efficient.

Cutting piece-work prices shows great ignorance and inexperience on the part of a piece-rate man, because it is a sign when some men make more money on their piece-work, that they are taking an interest in their work, and are hustling and working more efficiently. If their work is done properly they deserve all the money they can make. The chances are that if another man was put at the same work he would not be able to make half as much. A man should understand that the price set on a piece of work is satisfactory to the employer, provided, of course, that it has been set properly in the first place, and that what the employer wants first of all is production.

It pays the employer to treat the men with consideration and investigate their complaints, if any are made, and it may be necessary at times to raise a price to take care of certain unforeseen conditions on account of the hundreds of little things which have to be considered. If everything is given proper consideration there is no reason why the straight piece-work system should not be looked upon with favor by the employee, since through it he can make more money.

INDUSTRIAL DISPUTES.

THE annual report of the Department of Labor, Ottawa, for the year ended March 31 last, has been issued. Probably the feature of it in which most people are interested is the operation of the Industrial Disputes, or Lemieux Act.

The number of industrial disputes generally reported for the calendar year 1911 is somewhat above the figures reported for the previous year, being 97 as against 84. The strikes were chiefly of the smaller order, and the record of the year as to actual loss of time and other matters would have been particularly pleasing, but for the prolonged Western coal strike. The strike total for the year 1911, however, though higher than for the few years immediately preceding, is very much below the record of nine or ten years ago; in 1902, for instance, the total for the year was 123, and in 1903 the figures stood at 160.

Having in mind the large increase of population during the intervening period, the present record would seem to show some improvement of feeling as between employers and employees. Of the 97 disputes of the past year, the building trades were responsible, as usual, for a larger proportion than any other single group of industries; disputes in the building trades having totalled 30 for the year. The groups of industries coming next in order were the metal workers, clothing trades and transportation industries.

E. H. Mumford, of the Mumford Molding Machine Co., Plainfield, N.J., addressed the New England Foundrymen's Association on November 13, his subject being "Recent Phases of Molding Machine Development."

The "Bawden" Steam Pump

By Calliope.

THE Bawden'' steam pump being manufactured in Toronto by the Bawden Machine Co., Toronto, embodies in its design many features of interest to power plant engineers and those connected with steam and hydraulic installations generally. It is the outcome of 24 years' practical experience of steam pump design and manufacture, and presents, as its leading feature, simplicity of detail. The Bawden Machine Co. have secured the patent rights together with the services of Mr. Attwood, the patentee, whose record and extensive experience of pumps generally reflects success for this new achievement in the Canadian power field. The writer had the pleasure of seeing a trial pump in action, and, needless to say, was favorably impressed with its work.

The main idea, that occurs to one on close examination of the design and constructional detail are the concentration of effort apparent in furnishing the operating engineer with a simple and reliable mechanism, whose individual parts are easily accessible, thereby avoiding long delays for examination and repairs; and the subdivision of these parts so as to reduce cost of renewals in case of accident by frost or otherwise.

Detail of Construction and Operation.

The ''Bawden'' pump is governed by two piston valves which are a ground fit and are controlled by the action of live steam only. All tappets, levers, springs, rock shafts, tubes or other extraneous gear are dispensed with. A special feature of the piston valves is the arrangement for catching leakage of steam due to wear and tear, thus preventing the valves from getting into equilibrium at their driving ends, and resulting in a longer period through which they will work without repair. The steam piston is automatically cushioned at each end of the cylinder by a special design of the two main steam ports, dispensing with all adjusting mechanisms. There are no dead centres and there is no tendency to hang up. Claim is made also that it cannot be held up. It will run under full load at the fastest and slowest speeds, thus providing the engineer with a flexible pump for all purposes. The firm are making three types which are illustrated by the accompanying cuts:—

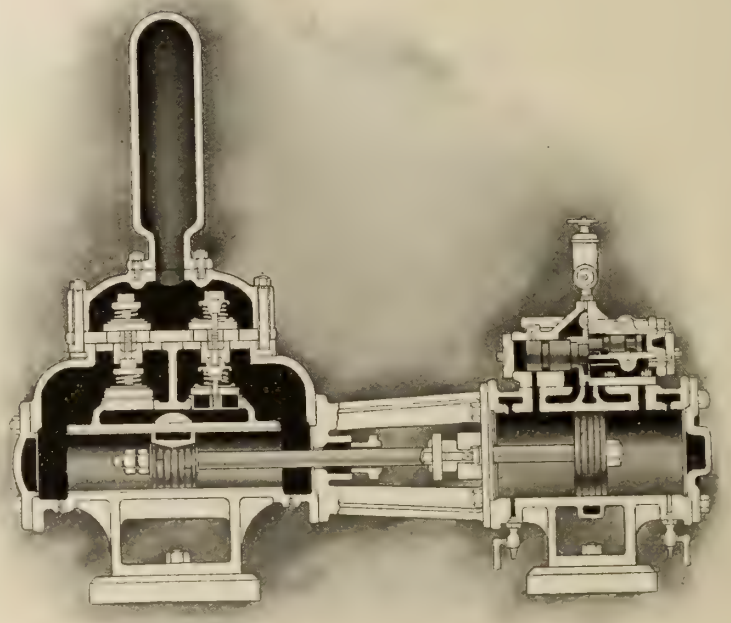

FIG. 1. THE "BAWDEN" PUMP FOR MODERATE PRESSURES AND VACUUM SERVICE.

Fig. 1 represents the regular line suitable for moderate pressures and vacuum service. These have packed water pistons, brass liners, and valve seats which are driven into taper seats and held in with brass stoppers accessible through handholes.

Fig. 2 also represents a pump with packed pistons but with outside valve boxes containing the water valves, each one accessible by removing top cover. This pattern presents special features, as all parts subject to pressure are cylindrical and consequently of great strength. In addition to the cost of renewals being less expensive, and the saving of time in examination and repairs, obstructions in valves are easily located and removed without disconnecting water pipes.

Fig. 3 shows the centre packed ram series, an attractive type for all high pressure work. This pattern favors a short stretcher, the piston rod is cottered into the ram and the valve boxes are bolted to the working barrels, a combination of good features, enabling pump valves to be easily examined, and leakage by packing glands to be always visible. All parts subject to pressure are in this type also cylindrical, consequently it has the advantages enumerated for Fig. 2.

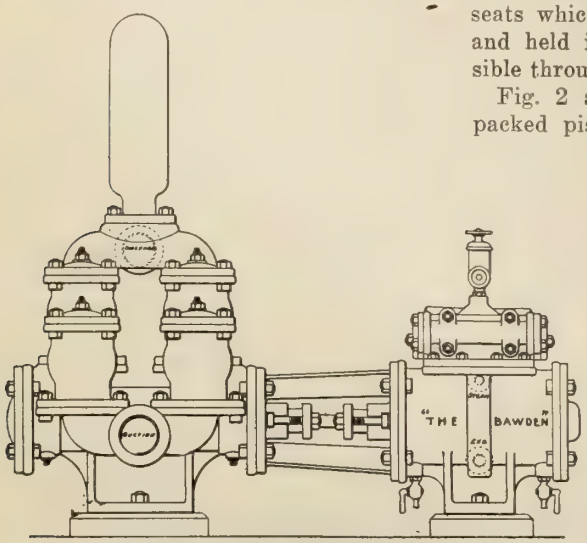

FIG. 2. THE "BAWDEN" PUMP WITH PACKED PISTONS AND OUTSIDE VALVE BOXES.

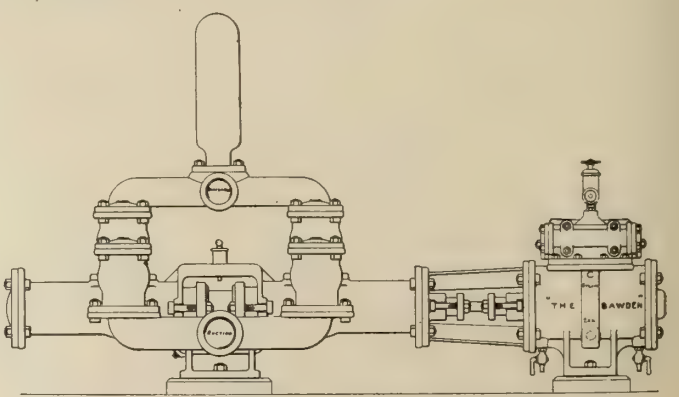

FIG. 3. THE "BAWDEN" CENTRE PACKED RAM PUMP.

In a conversation with Mr. Attwood we learned that his valve motion is equally satisfactory on compound cylinders of his design, and that in the near future we will have the opportunity to illustrate this type for boiler feeding and other purposes. The "Bawden" pump is especially adapted to general marine service, among many reasons being the absence of lever valve motion enabling the longest stroke pump to be used, a consideration which every engineer knows to be the best for producing the highest and most constant vacuum at moderate piston speeds.

The "Bawden" Compound Pump.

Where greater economy of steam is desired, compound pumps embodying the same valve gear as used on the simple units, are of course recommended. The high and low pressure pistons work in one cylinder, the steam and exhaust ports being of the shortest possible length and so arranged that the high pressure steam never leaves the cylinder casting, while exhausting into the low pressure cylinder. There are no external passages, therefore, radiation and condensation are reduced to a minimum. Only one steam chest is required with one valve to distribute the high and low pressure steam, the whole forming a most compact, reliable and economical pump for boiler feeding, fire service and general purposes. The "Bawden" compound pump will run at speeds varying from the very slowest to the fastest without any mechanical adjustments for cushioning the pistons.

What Education Means in Accident Prevention

By M. W. Mix

The writer of this paper shows the lack of universality of effort towards accident prevention; the movement being, as yet, confined to large manufacturing corporations only. Needless to say, he points out the urgency that exists for the smaller concerns being brought into line on this vital question.

WITH the development of the new doctrine of indemnity in the case of occupational accidents, which disregards the assumption of risk and negligence as defenses to the employer, it becomes necessary to consider the question from a purely educational standpoint, establishing collaterally therewith the doctrine of prevention of accidents. In nearly every large establishment, some special thought is being given to the safety of employes, and as a result, these employes are becoming aroused to the necessity of looking out for their fellow-workers and themselves.

Fundamental Reasoning.

The average individual at work for himself or in the pursuit of his own happiness, will take more chances with his life and limb than are necessary for him to take, even with the state of protection as it stands to-day, and there will be no change in this popular disregard for personal safety until there is an established public conviction, an active, yet sub-conscious state of mind that automatically thinks of "safety first." No employer designedly exposes his employes, and on the other hand, it may be said that few workers purposely put themselves in harm's way.

Years of education and sad experience have taught even the most heedless of men, owning property, that it pays to prevent fires. Such precautional measures with reference to fires are second nature to most people, and the same thought must be created in behalf of accident prevention. Again, the same relation must exist in all minds, with reference to accidents as exists with reference to contagious diseases. It will, however, be the work of a generation and perhaps two generations to bring every one to this state of mind. The education should commence from the cradle, be carried through the public schools, and then to the occupational field. All classes must be made to recognize its force from a standpoint of preventing waste, just the same as sickness is now being regarded. There will always be indifference, yet this may be largely overcome if the teachings are sufficiently impressive and started early in life. It is a case of drill—drill—drill.

The Movement not Sufficiently Comprehensive.

Just now the railroads, mines and manufacturing establishments are receiving the principal attention of the Social Welfare workers, but with this doctrine recognized as one of universal responsibility, it means that the entire public will be affected and must become aroused to the importance of a wise and equitable basis for dealing with the situation. Heretofore, such employers as agriculturists and horticulturalists; the small tradesmen, such as building contractors, involving a variety of craftsmen; employers of domestic labor, etc., have given but little heed to the progress of this question, yet it goes without saying that they will eventually become involved in its workings, because, man for man employed, or dollar for dollar of wages paid, the aggregate of these employments far exceeds those of the factories, and there can be no doubt of their ultimate responsibility under any Employers' Liability or Workmen's Compensation Act.

General Trades Lacking in Workers' Protection.

In none of these trades or occupations are there the same elements of protection to the workers, as in a well organized factory. Take the farm for example:—The machinery is more dangerous than factory machinery, the work conditions are more hazardous, man for man, and less attention is paid to the prevention of accidents. There is also lacking the fine discipline of an organized factory, and men take more personal chances every day. In Germany, statistics show that nearly 45 per cent. of the occupational accidents are in agricultural and horticultural pursuits, which demonstrates beyond doubt, the need for covering this field in all general relief measures. The same criticism as to exposure and protection may be made of the minor trades, where the number of employes per establishment is small and supervision is uniformed and correspondingly limited.

Hardship to Small Employer.

The working of the present laws, in a number of States, attaches a serious burden to the small employer, and it is, in fact, becoming a hardship for him to get labor on account of the lack of responsibility in case of accident, and this condition will be accentuated as time goes on. Insurance of some kind must be provided wherein the individual risk will be spread over the entire trade and be made compulsory. There can be no separating of the sheep and the goats, they must all go together, or the doctrine will fall of its own weight. It must be evident, therefore, that all hands must be "piped on deck;" all must become fully informed on this subject, and there can be no valid excuse to justify a lack of interest on the part of any employer or worker, else there may be a condition brought about that may throttle our very industrial life. This question may be first solved with such a vengeance that the much lauded system of protective tariff for infant industries would pale into insignificance, as against the protection that small employers may need under an extremely paternalistic solution of the occupational accident question.

Highly Developed Factory Inspection Required.

In addition to a national campaign of education, what is now needed, is a uniform nation-wide standard of protection to workers in the various lines of

employment, and coupled with it must be provided a highly developed form of standard factory inspection with appropriations of sufficient size to insure competent and ample assistants, and provision for complete statistics on all work accidents. At the present time, we must work more or less in the dark until proper standards are established, yet we may, meantime, receive much information from Germany, where are maintained as public records, full statistics on all trades and in all sub-divisions of the Empire. German standards of protection may not be suitable for us, but they may at least form a basis from which our own standards may be developed to suit our particular conditions, both in individuals and in occupational environment.

Warnings have been sounded against our going to extremes, and it not infrequently happens that after so much agitation, we may quickly adopt the principle and swing the pendulum so far to the opposite side that it may result in outraging a large number of dependent, thoughtless workers who have never been in the habit of exercising their faculties. Hardships are best endured by those who have had experience and to those who have never experienced danger, nothing seems dangerous. The Manufacturers' Bureau of Indiana has given much time and thought to accident prevention and workmen's compensation, and it firmly believes that any movement that does not include all employments will eventually fail, and that the greatest relief will be found in inaugurating a campaign of education throughout the State on accident prevention, and requesting a more complete system of State inspection and statistics than we now have, covering all employments, regardless of size or kind.

Dodge Mfg. Co. Plan.

In order to bring this matter of safety directly to the employes of the Dodge Manufacturing Co., the management has prepared a plan of education and competition between departments and their foremen. This is in the line of a percentage score board, such as indicates the standing of teams in the baseball leagues. The starting point is 1,000 and each division is penalized according to its accidents—minor accidents of less than one day's absence not as yet being considered. Each day's absence bears a percentage charge in proportion to the total number of men—days per month in each division. The foremen of all of the divisions scoring 1,000, or those holding the first three places below 1,000 will receive prizes of personal interest each month. The foreman scoring the largest number of first monthly prizes for one year, will receive a special prize at the end of the year. All divisions holding a percentage for the year of 1,000, or the highest annual percentage, will receive two days' full pay as a reward for their good record, and the second highest will receive one day's pay extra.

The plan is in rather a crude form at present, but it will be of daily interest, because of its competitive nature, and will facilitate the inculcation of preventative measures and of individual care and forethought, as well as speedy and prompt attention to reduce the severity of the accident and shorten the time of absence. At all events, the interest in the daily score board, which is 24 feet long, and erected at the main works' entrance, will afford a splendid vehicle for carrying influence to the worker. Each week also a spirited or expressive motto will be placed at the head of the board that is bound to have an excellent effect on the daily thoughts of the workers. The slogan must be—"Education" in order to produce in the individual mind an automatic, sub-conscious, ever-present thought to "look out for yourself first and the other fellow always."

Safety committees are good things, but they do not go far enough. They must educate the worker, the foreman and the official. All must be thinking of the subject: every individual must be a committee unto himself, and do so from the standpoint of a real interest in preventing accidents, stopping waste, avoiding suffering and disability to his fellowmen. When the whole factory or the whole field of workers will so regard accidents, the problem will have been solved. In the language of a famous advertiser—"Eventually, why not now?"

The foregoing is a reprint of a paper read before the Conservation Congress at Indianapolis recently by Mr. M. W. Mix, President of the Dodge Manufacturing Company, Mishawaka, Ind., and made available to us through his courtesy.

MANUFACTURING TERMINAL FOR MONTREAL.

A SYNDICATE has been formed in Montreal for the purpose of constructing a manufacturing terminal on a piece of land, about 16 acres in area, lying between Notre Dame street east and the river front in Longue Pointe ward. The property has a deep water frontage of 1,200 feet. A Federal charter has been applied for by the syndicate, which is to be known as Manufacturers' Terminal, Ltd. The authorized capital will be seven million dollars.

The scheme is to first of all construct four buildings, each four to five hundred feet in length by one hundred and fifty feet wide, and six storeys in height, with double track spurs running into each building unit, and thus, through the Harbor Commissioners' Railway, connecting with every trunk line railway in the Dominion, and with a dock and piers for the accommodation of ocean-going vessels. Each building will contain an area of about 400,000 square feet, or a total in the four buildings of 1,600,000 square feet. Floor strength and all handling equipment will be designed to meet the requirements of heavy products. Space, including heat and elevator service, will be let at rates which will be less than it would cost the individual manufacturer were he to own his own property. The buildings will be absolutely fireproof and of the most modern design and construction.

A NEW ZINC BRONZE.

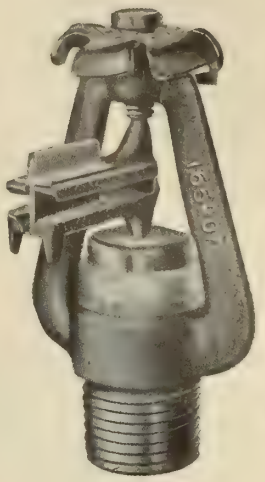
THE great strength necessary for bronze used in the construction of machinery, the keen competition existing between manufacturers, and the wide fluctuations in the price of tin, have induced metallurgists to study the question of substituting for the rather expensive tin bronze some special brass compositions (so-called zinc-bronzes), which not only have the advantage of being cheaper, but also, by far, surpass the tin bronze, so far as the breaking strength and elongation quality are concerned, at the same time offering the same resistance to attacks by acids.

As the result of a series of systematically conducted researches, the foundry laboratory of the Engineering Works of Escher Wyss & Co., Zurich, Switzerland, has succeeded in producing a zinc bronze, "Universal Bronze," which, besides being one of the most simple compositions imaginable, possesses a remarkably great breaking strength and tenacity, without presenting the disadvantages outlined above. Tests carried out during the last three years have shown this material particularly suitable for the construction of runners and impellers of pumps and turbines exposed to the wear and tear of high speed water or impure liquid or acids.

At the engineering works of Escher Wyss & Co., at Zurich, Switzerland, and at Ravensburg (Wurtemberg), "Universal Bronze" has been used on a large scale for several years in the manufacture of every kind of machinery parts exposed to heavy and sudden stresses, such as wedges, bearings, bushes, valves, stuffing boxes, screws, screw-heads, wings of propellers, runners for turbines, turbo-pumps, etc. Particularly in the construction of turbo-pumps for raising impure water or acids this new bronze has been a success.

The head office for Canada of Escher Wyss & Co. is at 514 Canadian Express Building, Montreal.

What Would Fire Do To Your Plant ?



Is your building, your machinery, your employees, your business, absolutely free from the possible ravage of fire? If not you should investigate

Manufacturers' Automatic Sprinklers

Let us tell you how Automatic Sprinklers work. How, with them, fire puts itself out by causing, with its own heat, a deadly spray of water to be discharged right at its heart before it has made any headway.

PAY FOR THEMSELVES

In addition to providing immunity from fire, **Manufacturers' Automatic Sprinklers will pay for their installation very quickly with the Insurance Premium they save.** This is a positive fact—investigate it.

Write or phone for full information, and if you desire it ask for an estimate on equipping your building.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

FOUNDRY AND MACHINE SHOP.

Toronto, Ont.—Mr. Gordon Perry, manager of the National Iron Works Company, has awarded a contract to Mr. John E. Russel for new buildings for extension to their cast-iron pipe foundry at Ashbridge's Bay. The new buildings will more than double the capacity of their plant, and the total cost will approximate $300,000. Work will be started at once.

Owen Sound, Ont.—The two new buildings for the Canadian Malleable Iron Co. are now under course of erection, and work is being rushed ahead as fast as forty or fifty men can accomplish it. The site selected is ideal. The old tramways of the Carney Lumber Company run east from the mill, then north and westward out towards the lake. The rectangle thus formed encloses a space of about six or seven acres and it is within this that the new plant is being built. The first unit is just north of the tramway running out from the mill. This building is 250 ft. in length and has a width of 80 ft. The foundation has been dug out and the concrete for the first course has been dumped in. The second unit lies to the north-west of the first building and will be the same size as the other. Thus, the two buildings will almost touch corners, being placed practically end to end and both running approximately east and west. It speaks highly for the energy displayed by Mr. H. A. Gutenkunst and the Raulf Construction Company's superintendent that, despite the vile weather conditions, such good progress has been made on the new plant. Given weather that is in any degree favorable the desire to have the buildings walled in and roofed by New Year's will be realized.

New Hamburg, Ont.—The Electrical Utilities Co., Toronto, Ont., has its new buildings at New Hamburg, Ont., nearly completed. The plant will include a brass foundry, iron foundry, machine shop, electro-plating and woodworking departments. Complete equipment will be required. James Fowler is president, and R. F. Smith, secretary.

Sutherland, Sask.—An arrangement has been come to whereby a company, known as the Saskatchewan Foundry & Iron Works, with capitalization of $50,000, will locate here. Soil pipe will be a special feature of the products. while general castings will, of course, form a large part of the output.

Guelph, Ont.—The erection of the Malleable Iron Works is nearly at a standstill because the Works Commission has failed to put the roads leading to the site in proper shape for traffic. The wet weather has made it impossible to haul heavy material for building purposes, and the commissioners are blamed for dilatoriness. The Guelph Stove Co. also complain, stating that the transportation companies have refused to send teams under present conditions.

Regina, Sask.—The Emerson Plow Co., of Rockford, Ill., are about to locate here. A property has been purchased and arrangements have been made for its adaptation to this particular business. Alterations are expected to be completed in about four weeks. The firm will carry a full line of tractors and farm implements.

Portage la Prairie, Man.—Announcement has been made by the secretary of the Board of Trade to the effect that the Economy Foundry Co., of Winnipeg, would be in operation shortly. It is understood that the company will not only repair machinery, but manufacture all kinds of castings, including builders and structural castings. A by-law was recently approved by the ratepayers, granting to W. J. McMartin, of Winnipeg, who is at the head of the company, partial exemption from taxation for a period of 20 years.

Edmonton, Alta.—There has just been shipped to Edmonton for the Portland Cement company over the Grand Trunk Pacific from Alliance, Ohio, en route for Marlboro, Alta., the largest plant of its kind in the Dominion. This includes three rotary kilns, each 140 feet long and eight feet in diameter, made of steel ranging from three-quarters to fifteen sixteenths of an inch in thickness and weighing 150,000 pounds exclusive of base and gear. Twelve flat cars, six of which carried the ends of the kilns on swivel blocks were required to convey the machinery whose total weight was 450,000 pounds. Before undertaking its delivery the railway company had men at work carefully checking the track curves and bridge clearances to make sure that there would be no obstacles. Altogether 300 cars of machinery and material have gone to build up the plant which will have cost $650,000 by the time it is running. This, it is hoped, will be early in January, when 1,500 barrels of cement will be turned out daily, the company having marl and clay supplies enough to last for at least forty years.

Moose Jaw, Sask.—The concrete foundation for the new general offices of the Saskatchewan Bridge and Iron Co. on Second Avenue, have been completed and the upper structure will be commenced in a couple of days. The building will have a frontage of some 90 feet on Second Avenue and will run back 24 feet to the wall of the iron shop. On the ground floor will be located the executive offices of the company while the upper storey will be the draughting rooms and designers' quarters.

Hamilton, Ont.—It is understood that the Canadian Roll and Machine Co. will erect a factory here. The Company is capitalized at $500,000, and proposed to spend $100,000 on the plant.

Davidson, Sask.—A new machine shop is about to locate here. Henry Nuessgen and Max Schroen propose to start business in the blacksmith shop recently owned by Messrs Allen & McNeil, as soon as the lathes and other machinery can be shipped.

MUNICIPAL.

Wadena, Sask.—A by-law has been passed by the burgesses here for the purpose of raising $20,000 as cost of the installation of an electric light and power plant.

Winnipeg, Man.—The ratepayers recently approved of a by-law granting $500,000 for the purchase of a site for the new exhibition building.

Windsor, Ont.—By-laws were recently passed by the Council authorizing the purchase of a fire engine at $12,500 and to grant the usual exemptions to the Leggett and Plott Spring Bed Company.

Humboldt, Sask.—The electric light and street grading by-laws both received the sanction of the ratepayers recently.

Trade Gossip

W. D. Beath & Son, makers of cranes, hoisting machinery and interfactory transportation systems, Cooper Ave., Toronto, are extending their machine and structural shops in order to handle the increased volume of business in the heavier lines of equipment which they are making. It is their intention to greatly broaden the scope of engineering work undertaken, specializing in overhead transportation systems for foundries and machine shops.

The General Supply Co., of Canada, Ltd., with head office in Ottawa, and branches at Toronto, and Winnipeg, have recently secured the Canadian agency for "Toledo" tool steel, of which John Henry Andrews & Co., Sheffield, England, are manufacturers. From what we have been able to learn of this specialty, its worth will appeal to a wide circle of users, and backed by the enterprise of the G. S. Co., it cannot fail to become exceedingly popular.

The Canadian Porcelain Co., Ltd., has been incorporated with a capital stock of $300,000, to manufacture vitrified white porcelain for electrical and other purposes. They have purchased a 20-acre site in Hamilton, Ontario, and will put up a plant, the first unit to cost $150,000. The buildings will be of steel and brick and will be ready for operation next Spring. George Alden, Chas. Palmer, of Rochester, and Fred. D. Palmer, of Galt, Ont., are the principal directors.

The Skinner Chuck Co., New Britain, Conn., has acquired the planer chuck business of the Francis Reed Co., of Worcester, Mass., and has moved the stock of finished chucks and patterns to the plant there. The Francis Reed Co. manufactures a line of improved drilling machinery and had manufactured the Jordan planer chucks for upwards of twenty years, but, wishing to concentrate its efforts on the manufacture of drills, disposed of its chuck business to The Skinner Co., who already manufactured a similar line of chucks.

The Smart-Turner Machine Co., Hamilton, Ont., have recently secured the following orders:—The Standard Steel Construction Co., Welland, Ont., Duplex Double Acting Power Pump; Wm. Bermingham, Goderich, Ont., Duplex Pump; The Chipman Holton Knitting Co., Hamilton, Standard Duplex Pump; Pratt & Whitney Co., Dundas, steam pump; National Sand & Material Co., Welland, Ont., Standard Duplex Pump; The St. Lawrence Paper Co., Single ActingTriplex Stuff Pump; Standard Chemical & Lumber Co., South River, Ont., Duplex Pump.

The H. Mueller Mfg. Co., Sarnia, Ont., will shortly begin operations. The site comprises 73 acres and the buildings in course of erection include a foundry, 60x190 feet, and a brass finishing department, 60x256 feet. Mr. Richard Lau has been appointed foreman of the foundry and Mr. W. C. McIntyre has been appointed superintendent of the plating and polishing department. The officers are as follows: O. B. Mueller, president and general manager; C. G. Heiby, vice-president and superintendent; Adolph Mueller, treasurer; and Fred. L. Higgin, secretary, assistant treasurer and general manager.

Not an Enterprise for the "Quitter"

¶ "If there is one enterprise on earth," says John Wanamaker, "that a 'quitter' should leave severely alone, it is advertising. To make a success of advertising one must be prepared to stick like a barnacle on a boat's bottom.

¶ "He must know before he begins it that he must spend money—lots of it.

¶ "Somebody must tell him that he cannot hope to reap results commensurate with his expenditure early in the game.

¶ "Advertising does not jerk; it pulls. It begins very gently at first, but the pull is steady. It increases day by day and year by year, until it exerts an irresistible power."

The advertiser would like to know where you saw his advertisement—tell him.

Sarnia, Ont.—The burgesses here have expressed themselves in favor of the by-laws to raise money for the cost of the waterworks system and to improve the market place.

Summerland, B.C.—It is proposed to submit a by-law to the burgesses soon to authorize the raising of $110,000 for irrigation and domestic systems.

Rosetown, Sask.—By-laws are about to be submitted to the ratepayers for approval to provide funds for a hospital and an electric lighting system.

Haileybury, Ont.—Owing to the fact that by-laws No. 350 did not receive the endorsement of the Ontario Railway and Municipal Board, it is now proposed to submit the same by-law to the burgesses. The said by-law calls for the issue of debentures to the extent of $20,000 for the purpose of improvement of water system.

Scott, Sask.—The town council has decided to submit to the ratepayers shortly a by-law to authorize the issue of debentures for $14,000 for the completion of the water and light systems.

Fort William, Ont.—The council has passed two by-laws : To raise by way of debentures $50,000 for electric light and telephone extensions, and to expend $80,000 for sewage system.

Penticton, B.C.—By-laws providing for the raising if $60,000 for the erection of a new school and to build sidewalks were recently passed by the qualified ratepayers.

Calgary, Alta.—The council recently passed the sewerage by-laws and also gave the third reading to the intake by-law, to cost $90,000.

Rapid City, Man.—The by-law providing for the issue of debentures to the extent of $12,000 for the erection of a complete electric plant received the endorsement of the ratepayers.

Sarnia, Ont.—The citizens have expressed themselves in favor of the by-law calling for the raising of $4,000 to cover the cost of waterworks improvements.

Preston, Ont.—The by-law to raise $25,000 as a loan to the Anchor Bedding Company received the endorsement of the ratepayers.

Cannington, Ont.—The ourgesses expressed themselves in favor of the by-laws to raise money to purchase power from the Hydro-Electric Commission.

Humboldt, Sask.—The burgesses here have passed two by-laws providing for the raising of $30,000 for electric light purposes and $3,000 for street grading.

North Battleford, Sask.—The school board here propose to borrow $8,000 to be used in installing waterworks, erectric lights, and other conveniences in the schools, thus a by-law to raise said sum is contemplated.

Rainy River, Ont.—It is proposed to submit a by-law to the qualified ratepayers to raise by way of debentures $1,500 as cost of waterworks system.

Rosthern, Sask.—The town solicitor has been authorized to prepare a by-law to be submitted to the people calling for the raising of $250,000 for cost of installing waterworks, sewers and an electric light plant.

Prince Albert, Sask.—It has been found necessary to submit again the by-law whereby $775,000 is to be raised for power development purposes. The above by-laws were passed last August, but owing to slight technical error are ruled as void.

London, Ont.—The burgesses will be called upon to sanction a by-law calling for the raising of $25,000 as a loan to the Finlay Electric Porcelain Company, which will establish a factory, to be the only one of its kind in Canada.

Windsor, Ont.—The people may be called upon to vote on a by-law to raise $20,000 to furnish machinery to enable the electric plant to comply with the demand made upon it.

Peterborough, Ont.—A by-law is to be prepared by which it is proposed to raise $10,000 to cover the cost of constructing an incinerator for the disposal of garbage.

ELECTRICAL.

Wilkie, Sask.—The town has just had electric lighting installed and as a result the business places and streets show the improvement.

Kingston, Ont.—It is felt here that more power is needed and a committee is at work upon the question of making a deal with J. M. Campbell for the supply of 500 horsepower from the falls at Kingston Mills, the rate being three-quarters of a cent per kilowatt hour, or $17.50 per horse-power.

Toronto, Ont.—It has been announced by the Vice-President of the Canadian General Electric Company, of Toronto, that this company will, within five months, erect an office and warehouse to cost $135,000. The building will be of red brick and cut stone, and will be four storeys high. The company is capitalized at

MONTREAL, QUE.

St. John, N.B. Vancouver, B.C.

In the United States, Simonds Mfg. Co.

$12,000,000 with $4,000,000 reserve. A. P. Horner is the local manager.

Montreal, Que.—The president of the National Hydro-Electric Company has reported that water power capable of developing $16,000 horse-power has been acquired at Carillion by the company, and that they are seeking to have the privelege of bringing more power to the city of Montreal. The installation will cost $10,000 and the small plant belonging to the company will soon be in operation.

Hanley, Sask.—The town has awarded the contract for the supply and the erection of an electric lighting installation to the British Canadian Engineering and Supply Co. This consists of a 50 brake horse-power Ruston Proctor producer gas engine and plant, together with all electrical equipment both for the inside and outside of the power house. The town of Wadena, Gull Lake and Outlook, have also contracted with the same firm for similar machinery.

Renfrew, Ont.—The town's power development plant is now finished, and many local industrial concerns are already patrons. After supplying these with power, there will be 400 horse-power left over.

Ottawa, Ont.—Two hundred and seventy-four miles of trackage to be operated by gas electric equipments is one of the features of the Ottawa and St. Lawrence Electric Railway, the survey of which is now nearing completion. It is going to be a system that will benefit the farmers along the route from Ottawa to Morrisburg, with several branch lines. The road is to be further extended from year to year until the whole of eastern Ontario will be served by an up-to-date standard service touching all the towns and villages within a line drawn from the city of Kingston to Pembroke and from the St. Lawrence river to Hawkesbury.

GENERAL MANUFACTURING.

Toronto, Ont.—The Harbor Commissioners recently leased a lot 200 by 425 ft. on the Ashbridge's Bay property to G. S. Lindsay, an interior woodwork manufacturer of Walkerville, who agreed to erect a large factory there, commencing operations in the Spring. Mr. Lindsay will pay $1,500 per year for the property. The commissioners based the price at the rate of 5 per cent. of the valuation of the property, which is held at $15,000 per acre. The lot is 2.52 acres in area. The factory will be of brick, concrete and other permanent material, and the lessee agreed to employ at least 40 men a year.

Palmerston, Ont.—The Worldridge factory, recently taken over by the Taylor-Scott firm of Toronto, is being remodelled. The factory, which is under the management of Messrs. L. E. C. Thorne and H. M. Perry, manufactures wooden ware and employs about fifty men. Among the improvements contemplated are a new heating and lighting system and laboratories. A contract has been signed by the Taylor-Scott Company with the Grand Trunk Railway for a new siding. A new machine shop has also been added.

Welland, Ont.—Further details have been made known, since the last issue, about the establishment of the Empire Cotton Co. The machinery is to cost $750,000 and power will probably be procured from the Ontario Power Company. The factory will use 8,000 bales of cotton per year and will turn out about 3,000,000 pounds of finished goods per annum. Mr. Grautham is president.

Montreal, Que.—An agreement has been reached between the city of St. John, Que., as first party and D. Lorne McGibbon, of this city as second party, whereby the latter agrees to deposit $100,000 as a guarantee that they will erect and have completed in two years a sugar refinery with an output of 2,000 barrels per day. The plant and building will cost $1,000,000.

Prince Albert, Sask.—The city council has ratified an agreement with H. C. Struchen, of Minneapolis, whereby Prince Albert will secure a $250,000 pulp and paper mill. The company asks for a free site of 15 acres but do not ask for a cash bonus or a guarantee of bonds. The site must have a small amount of water frontage.

Tillsonburg, Ont.—Fire recently destroyed the local pork factory to an extent of $40,000, partly covered by insurance. It is the object of John Lowden, the owner, to rebuild. It was his intention to build an addition costing $200,000, but he will now have an entirely new building.

Brandon, Man.—It is the intention of the E. V. Donaldson Co. to start construction work on their three storey boot and shoe factory in the coming year. At a conservative estimate it is stated, the concession granted to this company is worth easily $25,000; but it is believed that the value of the resulting benefits to the city will far exceed this sum. The new company is to be a Manitoba corporation capitalized at $75,000, the agreement with the city requiring that this amount of stock be fully paid up by June 1 next, and that all employees of the company be Brandon residents.

Lethbridge, Alta.—It is possible that in the near future the Taylor Milling Company may erect a flour mill here. The above mentioned firm will do this only on condition that they receive from the city the same concessions as were given to the Ogilvie Milling Company by the city of Medicine Hat, viz., a 20-acre site, free; free power for 15 years; water at cost, and exemption from taxation.

Calgary, Alta.—Work will be commenced within a month on a paper factory in Calgary to cost $75,000. Coarse grades of paper and cardboard will be manufactured out of straw. This will be the only plant of the kind in Canada, although there are a number of similar factories in the United States. The company who will build the plant is controlled by a Vancouver syndicate. The factory when in operation will employ fifty men.

Hanover, Ont.—The Fisher-Sander Co., of Berlin, manufacturers of sanding and rubbing machinery, proposes to operate in Hanover, and a company with an authorized capital of $40,000 is in course of formation.

Medicine Hat, Alta.—One of the most important deals, from an industrial viewpoint, if from no other, has taken place here recently: Warren Overpack has purchased the Purmal Brick Co's. plant, and the clay bed from Birnie Bros. for $150,000. The plant had been in the hands of the last named for thirteen months.

Lindsay, Ont.—The burgesses of this town will have the opportunity soon to add another industry to the present list of enterprises in the form of a furniture factory. An agreement has been drawn up between Frank W. Roy Fisher as first party and the town as second party, whereby the first party agrees to install $10,000 worth of machinery; carry out $3,000 of repair work to the Tudhope factory, already purchased for $20,000, and operate a pay-roll of $8,000 for four months previous to having goods marketed. In turn, the second party agrees to guarantee the bonds of the company about to be formed to the extent of $30,000 and to consider void all taxes against property.

New Westminster, B.C. — The Canadian Wheel & Wagon Co. has secured a building on Front Street here, and is about to commence the manufacture of the Tomlinson's patent, or 20th century wheel. New machinery has been installed, and efforts are being made to cope with the incoming orders. The above company is strongly supported by local men, and the field is open for a large output.

Preston, Ont.—The burgesses here declared themselves in favor of aiding the Anchor Bedding Co. by the loan of $25,000 in the erection of a factory. The firm, on the other hand, agrees to erect a factory 180 by 60 feet, two storeys high, with a moulding shop, and will employ at least fifty hands the year round.

Regina, Sask.—P. D. Hives, president of the Saskatoon Tent and Mattress Co., recently visited this city in connection with the transferring of the said company's factory and property to a local firm, viz., Stainco, of Regina, Limited. The new company anticipates to be able to manufacture woven wire, springs, cots, couches, roll-ups and mattresses. They hope to add to the present building, which is one of the finest in the Dominion.

SAW AND PLANING MILLS.

New Westminster, B.C.—Fire, estimated to have caused in the neighborhood of $200,000 damage, recently occurred in the mills of the Canadian Western Lumber Co. Eight dry kilns were gutted and over 500,000 feet of lumber was destroyed. The fire started in the dry kilns, but its origin is a mystery. It is believed that the loss is covered by insurance.

Milverton, Ont.—The local mill known as the Milverton planing mill, was recently damaged by fire. The interior is very much damaged, but the exact loss entailed or the origin of the fire is not known.

Nanoose, B.C.—The large sawmill here, owned by the Empire Lumber Co., is completed. The mill has a capacity for handling 150,000 feet per day, and has splendid prospects owing to its location.

Abbotsford, B.C.—Messrs. Hill, Tout and Anderson have established a sawmill near here for the cutting of ties. The company has secured a contract for eight months. A twenty horse-power electric motor has been installed, power being derived from the Western Canada Power Co.

Trenton, Ont.—The sawmill owned by Claude A. Nantin, of Gull Creek, was totally destroyed by fire. As the mill was not in operation at the time and there was no fire in the vicinity, the blaze is believed to have been of incendiary origin. The loss is estimated at about $1,600.

Moncton, N.B.—What is said to be the largest deal in lumber in this province has just taken place. The deal is the purchase of lands, mills and other properties of the

Coquitlam, B.C.—Actual construction has been commenced on the saw mill to be built on the site of the Coquitlam Shipbuilding & Marine Railway Company at Pitt River. This mill will be 160 feet in length by 50 feet in width. A contract for sawmill machinery, costing more than $22,000, has been let in Vancouver by the president, L. D. Shafner, to the Pacific Machinery Co. The machinery ordered will be sufficient to turn out from 25,000 to 30,000 feet per day. The Western Canada Power Co. will furnish electric power.

Montreal, Que.—Fire recently broke out in the sash and door factory of Victor St. Andre & Fils. The flames spread so quickly that despite the strenuous efforts of the fire brigade the building was consumed. The total cost is estimated at $30,000.

North Lake, Ont.—The lumber yards of A. Bishop & Co. were destroyed by fire. The value of the lumber is estimated at about $30,000. The origin of the fire is unknown, but it is supposed to have originated by a spark from the mill.

Lindsay, Ont.—The loss sustained by the Baker Lumber Co. amounted to $9,000. This was fully covered by insurance, and it is the intention of the owner to rebuild and have the new mill ready by April next.

BUILDING NOTES.

Vancouver, B.C.—Two new post office substations are about to be built here. Sites for the same have been secured, and plans for the buildings, each of which will cost $100,000, have been prepared.

Winnipeg, Man.—Work has practically been finished on the $300,000 structure of the Dominion Express Co., and it will shortly be occupied. No expense has been spared to make the building worthy of the company. It is 94 and 48 feet wide and 277 feet in length.

Toronto, Ont.—A by-law to provide money for the building of bridges has been introduced in the City Council. It is proposed to erect the following bridges: Crawford Street bridge, to cost $29,450; Strachan Avenue bridge, $58,000; Riverdale foot bridge, $12,000; Gerrard Street bridge, $200,000; Weston Road bridge, $14,000, and Dundas Street bridge, $11,800.

Regina, Sask.—It has been decided by McCallum and Hill to add two more storeys to their new building on Scarth Street. The original plans were for eight storeys, to cost $325,000. Being ten storeys high the building will be the highest in the province. The promoters intend to put in their own power plant, and the additional storeys will necessitate three elevators instead of two, as at present planned.

Ingersoll, Ont.—Messrs. Nagle & Mills have been awarded the contract for the erection of the proposed Imperial Bank building at the corner of King and Thames Streets. The buildings will be of red brick and cut stone, and will cost about $30,000. Work on its erection will be commenced in the spring.

Moose Jaw, Sask.—A large building enterprise is about to be launched here in the form of a new hotel, to cost about $700,000. W. L. Brackett, who is the promoter, has offered to bear 65 per cent. of the cost. The building will be twelve storeys high, and will be leased for thirty years. It will have 110 feet of frontage and 80 feet depth. The location has not been decided yet.

Weyburn, Sask.—A new hotel, to cost $100,000, is to be built here in the near future. The structure will be located on Government Road, and will be four storeys high, fireproof and modern in every respect. It will have 100 rooms, with provision for an additional 100 if necessary. Plans for the same are being prepared by De Brewere & Boyum, architects, of Weyburn.

Vancouver, B.C.—The Norton Griffiths Steel Construction Co. have been awarded the contract and have commenced ork on the construction of the Merchants' Ice and Cold Storage Co.'s warehouse. The building will be 300 feet long and 100 feet wide, and two storeys high. Reinforced concrete will be used in construction throughout. It will be fitted with rolling doors and metal-framed windows. The cost will be $175,000.

Winnipeg, Man. — Work is progressing quickly in connection with the new agricultural college, administration dormitory, horticultural and biology, chemistry and physics buildings will soon be finished. Boilers are being installed in the power house, and tunnels for light and heat purposes are already built. The completed work will cost over $5,000,000.

Winnipeg, Man.—Extensive alterations to the Royal Alexandra Hotel and the local station are planned by the C.P.R. Work will be commenced in a few weeks. The cost

will be about $1,000,000. The extensions and alterations will be so general that the whole appearance of the C.P.R. block will be changed, and the improvements will affect the hotel and station, both of which will be practically doubled in size. A large grill room, a ballroom and banquetting hall, besides 300 new bedrooms will be the principal additions to the hotel. The station itself will be practically doubled in size by moving the front forward, and so bringing it level with that of the Royal Alexandra.

Vancouver, B.C.—Instead of building a central section of eleven storeys, to cost about $800,000, according to the plans filed at the building inspector's office, the C.P.R. will extend part of its new Hotel Vancouver structure up some sixteen storeys. The cost of the central section to be made sixteen storeys high will run to about $1,200,000 instead of $800,000. The building inspector expects to grant a permit for it well before the end of the year.

Winnipeg, Man.—The new building of the James B. Brown Co., on Notre Dame Avenue and Home Street, is now completed. The building is three storeys high, with basement, 75 by 100 feet, and will cost $50,000. Plans were drawn by Edgar Prain, and the building was erected by Clayton Bros.

NEW INCORPORATIONS.

The Fisher Machinery Co., Ltd., Hanover, Ont., has been incorporated at Ottawa with $50,000 capital to conduct an iron foundry and machine and repair shop, and to manufacture and deal in machinery. The incorporators are Daniel Knechtel, Jacob Stadelbauer Knechtel, Henry Peppler, William Henry Fisher, Benjamin Frederick Ahrens, Henry Horton Miller, James Henry Adams, Henry H. Engel and Arthur William Fisher, all of Hanover.

The Wilt Twist Drill Co. of Canada, Ltd., Walkerville, Ont., has been incorporated at Ottawa with a capital stock of $150,000, and the following incorporators: Hobart Anderson Springle, Sidney Cecil Robinson, Walter Chater, Edgar Francis Ladore and Hiram Holicomb Walker, all of Walkerville. The company will manufacture and deal in machines, engines, tools, instruments and mechanical and electrical supplies.

J. B. Baillargeon Express, Ltd., has been incorporated at Ottawa with Montreal head office, to manufacture and deal in tools, implements, motor and other vehicles, engines, steam plants, etc. It has an established capital of $1,500,000, and its incorporators are Messrs. Clovis Joseph Baillargeon, of Outremont, Que.; Romeo Gaudry, George Lefort, Rene Beauchemin, and Joseph Treffle Primeau, all of Montreal, Que.

CATALOGUES.

"What We Make" is the title of a compact 48-page book issued by the Green Fuel Economizer Company, of Matteawan, N.Y., describing fuel economizers, both standard and special, coverings for fuel economizers, mechanical draft outfits, heating, ventilating and drying outfits, hot blast heaters, steel plate fans, motor and engine driven fans, cast iron volume blowers, slow speed and standard speed planing mill exhausters, fan and cone wheels, wool wheels, ventilator wheels, propeller fans, vertical and horizontal engines, and mechanical draft dampers.

"Hydraulic Leather Belt Presses," catalogue No. 88, published by the Watson-Stillman Co., 50 Church St., New York, is just off the press. It illustrates, describes and lists six distinct types of leather belt presses built by the Watson-Stillman Co., and in addition shows types that are generally used in conjunction with their hydraulic presses. A free copy will be sent on request.

The velocity stage type of DeLaval steam turbines is described in a 48-page booklet recently issued by the **DeLaval Steam Turbine Company, of Trenton, N.J.** This turbine, with a single pressure stage, is built in sizes up to 600 H.P., and is suitable for direct connection to centrifugal pumps and blowers and small A.C. and D.C. generators, etc. With the intermediation of gears, the turbine may be adopted to drive slow and standard speed machinery, also for use with rope or belt drives. The pamphlet outlines the factors affecting the suitability of different types of turbines for the several services involved; the speed problem as bearing upon the type of turbine to be selected; methods of velocity staging for small turbines, such as the use of multiple rows of buckets with intervening guide vanes, or returning the steam jets upon the original row of buckets, and practical considerations, such as renewability, governing, non-penetrable casings, shaft design and freedom from vibration, bearings, the strength of wheels, the best form and material of buckets to resist erosion, ease of access to internal parts, economy, facilities for changing the nozzles to meet changes in steam conditions, etc. This form

Don't be satisfied by asking for just Drills.

"Say 'Morrow' Drills"

Then you'll be sure you have the best. The kind the makers freely guarantee. The kind that really will do more work. Morrow Twist Drills will not only do more work—drill more holes—but will drill perfectly round holes—more than you can say of some makes.
All the makers ask is that you try them and you'll use no other make.
Also,
Largest makers of accurate set and cap screws, semi-finished and finished nuts, Engine Studs, etc.

50 Pearl Street - TORONTO, CANADA

of turbine is built for all steam conditions, i.e., receiving high pressure steam and exhausting to condenser or atmosphere, or against back pressure, or operating on low pressure steam, either alone or with mixed flow. Copies of the book will be sent gratis to those interested in steam power plant equipment.

Jenkins Bros., Ltd., Montreal, have favored us with a copy of their latest pocket catalogue and price list of their globe and gate valves and other specialties.

Jeffrey Mfg. Co., Montreal, have issued Bulletin No. 74, which consists mostly of numerous excellent half-tones illustrating various types of freight and package-handling machinery, elevators, conveyors, etc.

The Eastern Machinery Co., New Haven, Conn., send us the price list No. 6. In this are described the firm's line of improved Frisbie friction clutches, clutch pulleys, etc.

Tate, Jones & Co., Inc., Pittsburgh, Pa., have issued a well gotten up catalogue of their appliances for burning fuel oil. These include burners for boilers, kilns, steel furnaces, etc., etc. A section of the book deals with pumping systems for distributing fuel oil at a uniform pressure over large systems.

The British Anti-Vibration & Noise Co., Ltd., Glasgow, Scotland, are specialists in the isolation of vibration and noise caused by machinery. They have forwarded to us a copy of their booklet, which sets forth the manner in which the desired end is accomplished. The method, it is claimed, is entirely successful, and can be applied to all kinds of machinery.

The Agnew Electric Welder Co., Ltd., Walkerville, Ont., have mailed us a bulletin descriptive of their line of Butt and Spot Welders. One of the principal advantages in favor of these machines is their very low current consumption, a point that will appeal strongly to prospective purchasers. In the butt-welders particular attention has been paid to the means for bringing parts to be welded together into quick yet accurate alignment. The movable carriage is of extra length, with bearings so disposed that perfect alignment is positivety assured. Parties interested are invited to write for this bulletin.

The Canadian Bond Hanger and Coupling Co., Alexandria, Ont., have issued Catalogue 25, dealing with their line of power transmission equipment. The various hangers, brackets, pillow blocks, etc., are made both with ring oiling or grease lubricated bearings. The bond graphite bearing is also a favorite, especially in silk or fabric mills, where cleanliness is so essential. Another well known line is the Lytestrong steel shaft hanger which is scientifically constructed, the metal being folded to give a maximum of strength and rigidity with a minimum of weight.

The Canada Wire & Iron Goods Co., Hamilton, Ont., have mailed us a copy of their latest catalogue No. 3. The firm specializes in ornamental wire and iron work, brass wire goods, elevator enclosures, wickets, window guards, grilles, gates, etc., etc. In fact the firm's slogan "If it's made of wire, we make it," sufficiently indicates the field covered.

The Dodge Mfg. Co., Toronto, have forwarded a copy of their "Condensed No. 30" price list, which gives recently revised prices of the leading lines of transmission equipment manufactured by the firm, such as wood and cast iron pulleys, friction clutches, floor stands, hangers, pillow blocks, mule stands, rope sheaves, etc., etc.

The L. S. Starrett Co., Athol, Mass., recently favored us with a copy of their latest catalogue of the well-known Starret steel rules, micrometers, bevel protractors, speed indicators, etc., etc.

M. Beatty and Sons, Ltd., Welland, Ont., are sending out a finely illustrated bulletin showing examples of their hoisting engines, centrifugal pumps, derricks, dredges, scows and clamshell buckets. The production is very elaborate to be called a bulletin, but the firm so style it themselves and explain that it is being issued pending the compilation of a more complete new catalogue.

The Cost of HANDLING MATERIAL

is actually an incredible amount. Unless you have given this factor of your expense your careful consideration its magnitude **will surprise you.**

Just consider how much it costs you to place a heavy casting in position for machining, not only for labor, but for the time your machine is idle waiting for work to be placed.
Then consider that one man with an Ingersoll-Rand Air Hoist can, with little effort, accurately place heavy pieces of work in record time and *save most of this expense.*

Ingersoll-Rand Air Hoists are equipped with an operating valve of unique design which has an unusually sensitive control. This device renders our hoists suitable for use where accurate adjustment of the load is imperative. It also eliminates all valve leakage, thereby soon saving its own cost in compressed air.

564 DOZEN PANS IN 10 HOURS!

LABOR COSTS CUT FROM 10c PER DOZEN FOR RIVETING, TO LESS THAN ½c PER DOZEN BY OUR METHOD AND THE OPERATOR MAKES BETTER WAGES THAN HE DID BEFORE.

Let us show you how you can reduce your costs from 60% to 250%. We back up our statements and prove them. Your name and address, please.

THESE MACHINES MADE IN CANADA

To take care of our rapidly increasing business in Canada, we have opened a branch at Brantford, Ontario, where our complete line of spot and butt welders will be built in the future. This office will be managed by Mr. H. B. Warren, who will look after all Canadian inquiries, and quote prices F.O.B. cars Brantford.

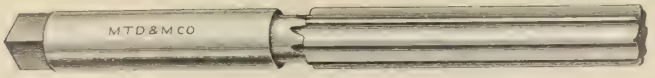
NO LEASE NO LICENSE NO ROYALTY

The Toledo Electric Welder Company

Home Office: Cumminsville, CINCINNATI, OHIO

Canadian Branch, H. B. Warren, Mgr., BRANTFORD, ONTARIO

"MORSE" REAMERS



are made in many different styles and for many different purposes. Are used in the largest and most experienced machine shops in this country.

They are clean-cutting tools of high quality. Will bear the closest inspection.

It is policy for you to make their acquaintance.

Carbon and High-Speed Steel

Fully illustrated in our 350-page Catalogue which is yours for the asking.

Morse Drills and Tools are sold by Rice, Lewis & Son, Limited, Toronto; Aikenhead Hardware, Limited, Toronto; Frothingham & Workman, Montreal; Mechanics Supply Co., Quebec.

Morse Twist Drill & Machine Co.
New Bedford, Mass., U.S.A.

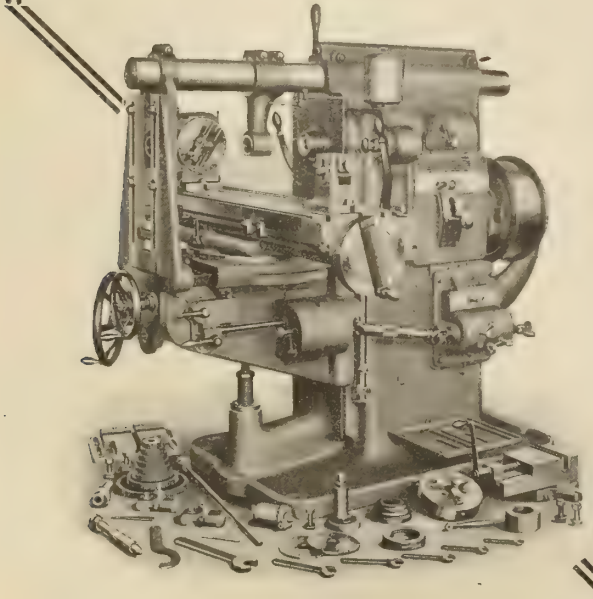
J. B. H. Rickaby, Victoria, B.C. Geo. D. Hatfield, Halifax, N.S.

Locomotive Shop Tool Room Milling

requires massive universal milling machines like that shown in the cut. **All B. & S. Heavy Universal Machines** are well adapted to this class of work, for they are exceptionally rigid and capable of producing accurate work under every practical condition. In addition they are economical and handy to operate — points of value to both owner and mechanic.



Special circulars of any machine gladly furnished.

Brown & Sharpe Mfg. Co.
PROVIDENCE, R.I., U.S.A.

Agents: The Canadian Fairbanks-Morse Co., Limited, Toronto, Winnipeg, Calgary, Vancouver, Montreal, St. John.

LAFFITTE

WELDING PLATES

A SCIENTIFIC CHEMICAL WELDING COMPOUND. WELDS IRON AND STEEL AT A REMARKABLY LOW HEAT.

You are not taking our products seriously enough; unless your blacksmith asks for it you never give it a thought. We can easily reach the smaller man who must consider every economy, but we cannot get at the man in your shop.

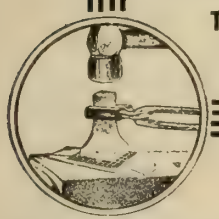
The larger you are the more you need LAFFITTE.

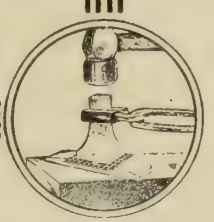
Let us send you samples. There are endless economies you can effect, and the cost is insignificant compared with the results.

DEALERS THROUGHOUT CANADA HANDLE LAFFITTE

The Phillips-Laffitte Co.,
Penna. Bldg. Philadelphia, U.S.A.

ASK FOR AND GET LAFFITTE





Let the "Brazo-Hardening" Process Save Half Your Reamer Costs

The benefit accrues to you in this way. Our

"PEERLESS" HIGH-SPEED REAMER

has blades of the finest quality, selected high speed steel, solidly joined by our patented "Brazo-hardening" process to a one piece soft steel body. We can thus provide durable cutting edges and a soft, tough supporting body at about half the cost of other high speed reamers.

"Peerless" Blades *never come loose*—a new reamer if they show evidence of such a defect. That's a liberal enough guarantee to make you interested in full details.

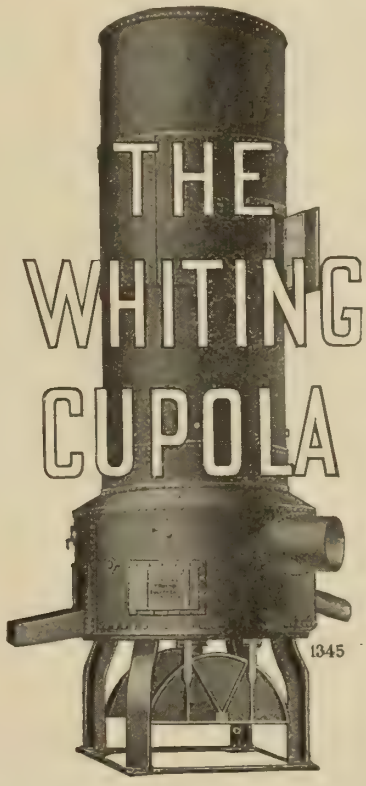
All Types---For Every Service

Complete Foundry Plants

We make a specialty of complete foundry plants for any class of castings — grey iron brass, car wheel, pipe, steel (O. H. and converter), or malleable. We prepare layouts showing location of all machinery, furnish and install equipment, and conduct initial operation, relieving the customer of all risk. Send for our complete catalogue. Information gladly furnished.



Cupolas	Core Oven Cars	Furnaces (Brass, Malleable & O. H.)	Tramrail systems
Tumblers	Elevators		Turntables
Trucks	Air Hoists	Annealing Ovens	Sand Sifters.
Ladles, Core Ovens	Converters

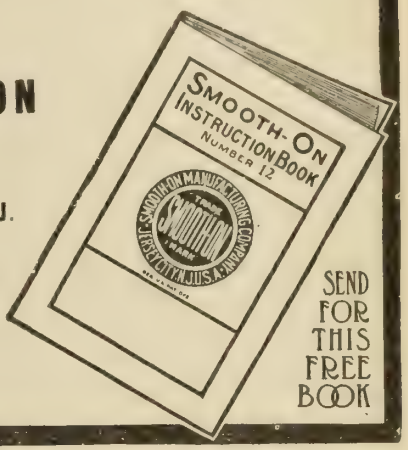
For Sale by Supply Houses.



SEND FOR THIS FREE BOOK

You May Have This Book Without Spending a Cent

if you are a subscriber to "Canadian Foundryman," by sending in to us four new paid-up subscriptions. If you are not a subscriber send in your own, along with the proper number of paid-up subscriptions and the book is yours.

Foundry Work

By Wm. C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

Price, $1.00

Given free with four yearly paid-up subscriptions.

The subscription price is fifty cents per year; two years for one dollar.

Nova Scotia Steel and Coal Company, Ltd.

BEGS TO ANNOUNCE

That their new Steam-hydraulic Forge Shop is now in operation, as also is their recently installed "Harmet" Fluid Compression Plant.

These improvements bring "Scotia's" Equipment abreast of the best foreign forges.

They are accordingly open to supply forgings of all shapes and sizes, made of Best Ordinary or Fluid Compressed Open-hearth Steel, and satisfying the most severe specifications.

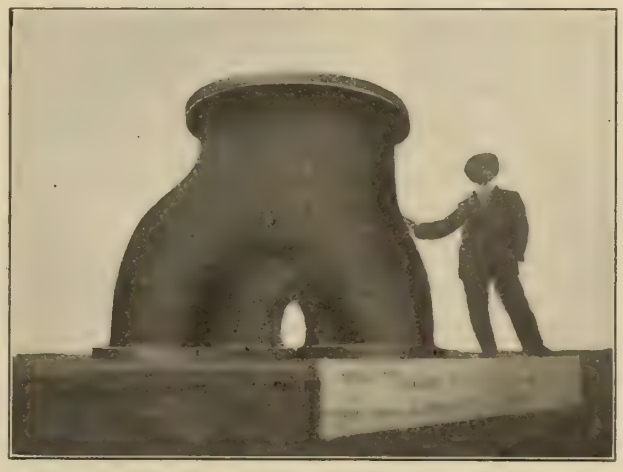
For prices and particulars apply to

Western Sales Office, Room 14, Windsor Hotel, Montreal, Que., or Head Office, New Glasgow, Nova Scotia

STEEL CASTINGS

Our castings are as perfect and efficient as castings can be, yet they can be procured at a price that will ensure economy.

Let us submit you estimates before placing your next order. Write to-day.



Casting for a 10,500 H.P. Water Wheel.

We make New Process Converter Steel Castings, annealed and unannealed.

We also make Chrome Manganese Nickel Steel Castings.

Made in any size from ¼ lb. to 3000 lbs. and **guaranteed right.**

Dixon Crucibles

EVERY crucible made by DIXON since 1827 has been made with the one idea of giving reliable service.

¶ In doing this nothing has been so helpful as our experience and our study of actual foundry conditions. ¶ In the purchase of raw material, in mixing it correctly, in spinning up the crucible, wherever there has been any question our experience has been called upon to give the final answer.

¶ Write for our booklet No. 223-A on the care and use of crucibles.

Joseph Dixon Crucible Company
Jersey City, N. J.

Which Journal do you use when in the market for Shop Equipment or Supplies?

THIS Directory is run every month at considerable expense for the benefit of our readers—*your* benefit.

¶ You will find listed practically every machine shop or foundry requirement, from twist drills to coach wheel lathes, and from foundry facings to cupolas.

¶ You will find under each heading from one to a dozen names of reliable firms anxious to furnish information for the asking.

¶ Turn from this directory to our advertising pages and study carefully what our advertisers say regarding their product.

¶ You do not derive half the possible benefit from any one issue of Canadian Machinery unless you study the advertising pages.

¶ The most progressive firms *believe* in advertising, and these are the firms who are constantly employing the best designers in order to keep their product thoroughly up-to-date.

¶ In his space, the man who is spending his life perfecting his product, tells you briefly about a few of the outstanding features. It is your privilege to write and get *complete* information, and that information is going to help you get better results.

Refer to Canadian Machinery Directory and Advertising pages---you will help us, the advertisers and yourself.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.
TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.
TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

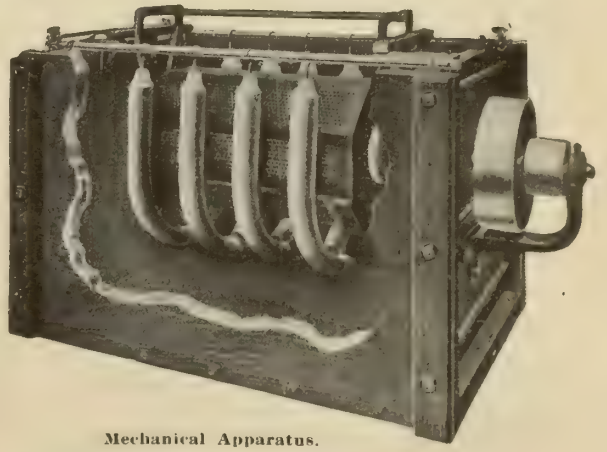
Electro-Plating Apparatus and Materials

GENERAL FOUNDRY EQUIPMENT

We manufacture all classes of plating supplies in Toronto. Prompt shipments.

Buffs	Carbonate of Zinc
Buffing Compositions	Cyanide of Potassium
Copper Anodes	Cyanide of Sodium
Brass Anodes	Pumice Stone
Zinc Anodes	Pure Turkish Emery and Glue
Nickel Anodes	Canvas Wheels
Polishing Wheels	Sheepskin Wheels
Nickel Salts, Double	Felt Wheels
Nickel Salts, Single	Bull Neck Wheels
Nickel Salts, Black	Brass Wire Wheels
Carbonate of Copper	



Mechanical Apparatus.

Kostico Better than Potash or Caustic Sodas. For preparing work for Plating.

Pickelene Takes the place of acid Pickles. Dry salt, no Injurious Fumes.

Electro Chemical Cleaning Salts

WE ARE THE ORIGINATORS OF AND HEADQUARTERS FOR

COLD GALVANIZING.
AMERICAN PROCESS.

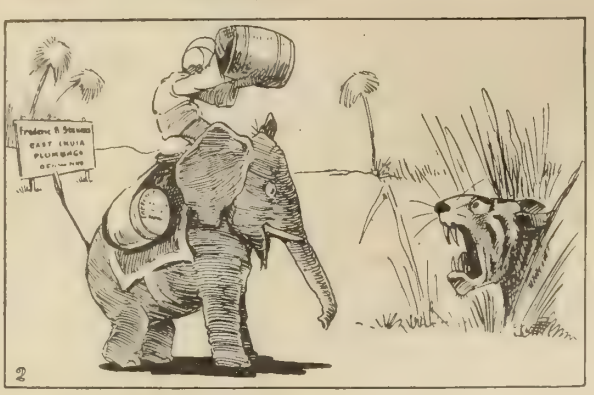
Eastern Warehouse: 579 St. Paul Street, MONTREAL



2

On the Defensive!

There are times when the Foundryman is on the defensive.

It is when the tiger of competition is too self-assertive.

In the reduction of costs a new profit is created.

Stevens' Pure Plumbago reduces cost

One New York Foundryman writes:—

"Your Lead gives me the best peeled castings I have had for a long time, and the color is right, too."

That means that this Lead does the work expected in the Foundry instead of leaving it for the scratch-room or the chipping room to finish.

That means labor saving and cost saving.

Each shipment has its return ticket—it may be returned and freight paid by me both ways when not satisfactory.

The entire risk is on me!

Its use squelches all tiger danger.

I manufacture the entire line of **Foundry Facings and Foundry Supplies**, and the quality stamp impresses them all.

FREDERIC B. STEVENS

Peels Clean

Will Slick, Rub Or Dust On Mold

Will Not Roll or Wash

We want you to be convinced as to the merit of this Plumbago.

Let us send a barrel on approval. If it does not prove satisfactory we will take it back. **You cannot afford to overlook this trial offer.**

The molder who is using our No. 48 thinks it is a "Happy Habit," because it makes perfect castings at a saving in time.

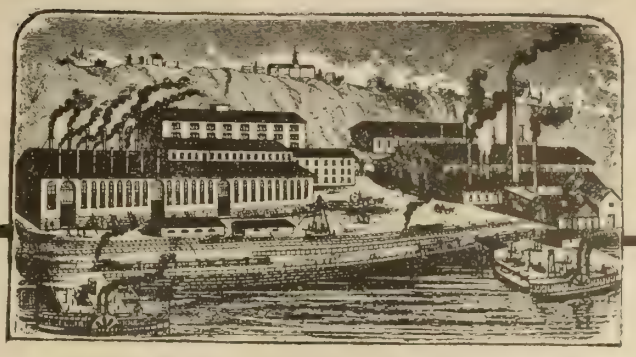
We also make a higher grade in our No. 46, and a lower grade, No. 47.

The Detroit Foundry Supply Co.

Foundry Supplies, Platers' and Polishers' Supplies.

DETROIT. MICH. **WINDSOR, ONT.**

MARINE ENGINES and PUMPS. SHOE MACHINERY A Specialty



BRASS and IRON CASTINGS. BOILERS and REPAIRS.

That we have exceptional facilities at our disposal for the manufacture of all kinds of Machinery—in addition to our business as Brass and Iron Founders, General Contractors and Shoe Machinery Engineers—has been amply proved this year. In the short space of five months, we built and installed all the Engines and Boilers of the new sister steamers "Levis" and "Lauzon," whose trial trips were a complete success. We make a specialty of all kinds of Marine Engine Work, and shall be glad to quote for first-rate products only.

SHOE MACHINERY. Manufacturers of "Non-Royalty" Machines, Metallic and Goodyear, "Fortuna" Skivers, and "Climax" Presses, Sand-papering, Lasting and Loose Studding Machines.

Wire of every description for Slugger and Standard Screw Machines.

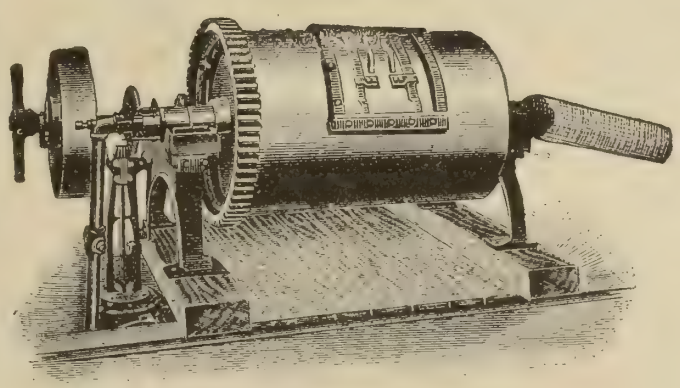
The Canadian General & Shoe Machinery Company, Ltd.

ERNEST CARON, Managing Director

LEVIS, Quebec

A GOLD MINE

SAVE YOUR IRON



SLY'S PATENT IRON CINDER MILL

Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the iron contained in your cupola dump and gangway scrapings and 75% of the coke. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

THE W. W. SLY MFG. CO., CLEVELAND, O.

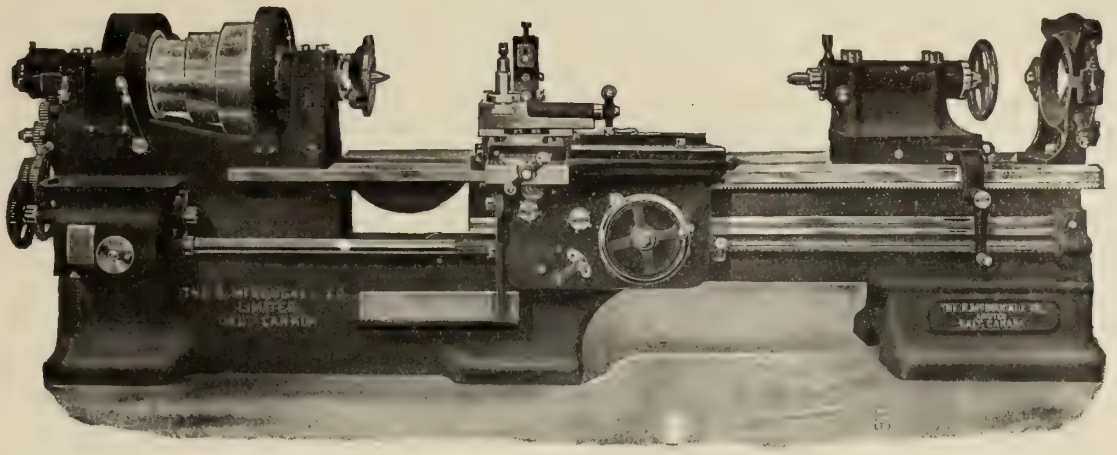
Do Your Lathes Congest Your Factory?



IS your lathe-work holding back your production by slowness, lack of strength, want of accuracy, unsuitability of type or size? The lathe department is a critical factor in the quality of your product. It may be the cause of congested order sheets.

The massive and solid McDougall Gap Lathe handles every type of work it is adapted for, with the least dead time and the longest productive time. It is the ideal tool for turning out clean, accurate, smooth work. It has the solidity, bearing surface, and proportioning necessary.

Note the bed and supported gap. The extension of the headstock footing beneath the gap gives absolute solidity, and also permits a gap of extra capacity. The bed is strongly supported and ribbed. The sides of the bed form a wide supporting girder.

This construction insures the highest quality of work by forming a perfect base for the carriage and tool rest. The apron has a wide bearing, and gives accurate, even and smooth travel. Bearing surfaces are extremely large, with corresponding solidity.

The feed is of the safety interlocking type, preventing accidents. The compound rest reads to thousandths of an inch both ways. Absolute accuracy of cut is insured with minimum adjustment delays.

Put this wonderfully efficient McDougall Gap Lathe in your factory. It has the strength to handle a deep cut at slow speed. The massiveness and liberal bearings for the rest prevent chattering, even at high speed cutting in hard steel or cast iron.

We will be glad to correspond with you. We have shown you the quality and strength of the McDougall Gap Lathe. We want to tell you of the "quick-change" features, the top-adjusted tailstock, the eighteen spindle speeds, the speedy manipulation of this big lathe that makes it as swift, handy and economical as a small machine.

Instal McDougall Lathes in your factory. They will handle your product speedily and swiftly, and will prevent factory congestion, because they have the reserve capacity to turn out product with least labor time devoted to adjustments and changes.

Correspond with us. We have choices of gap (with bridge) and length of bed to offer you. We can give you valuable assistance in installing a battery of McDougall Gap Lathes suited to your product.

The R. McDougall Co. Limited, Galt, Canada

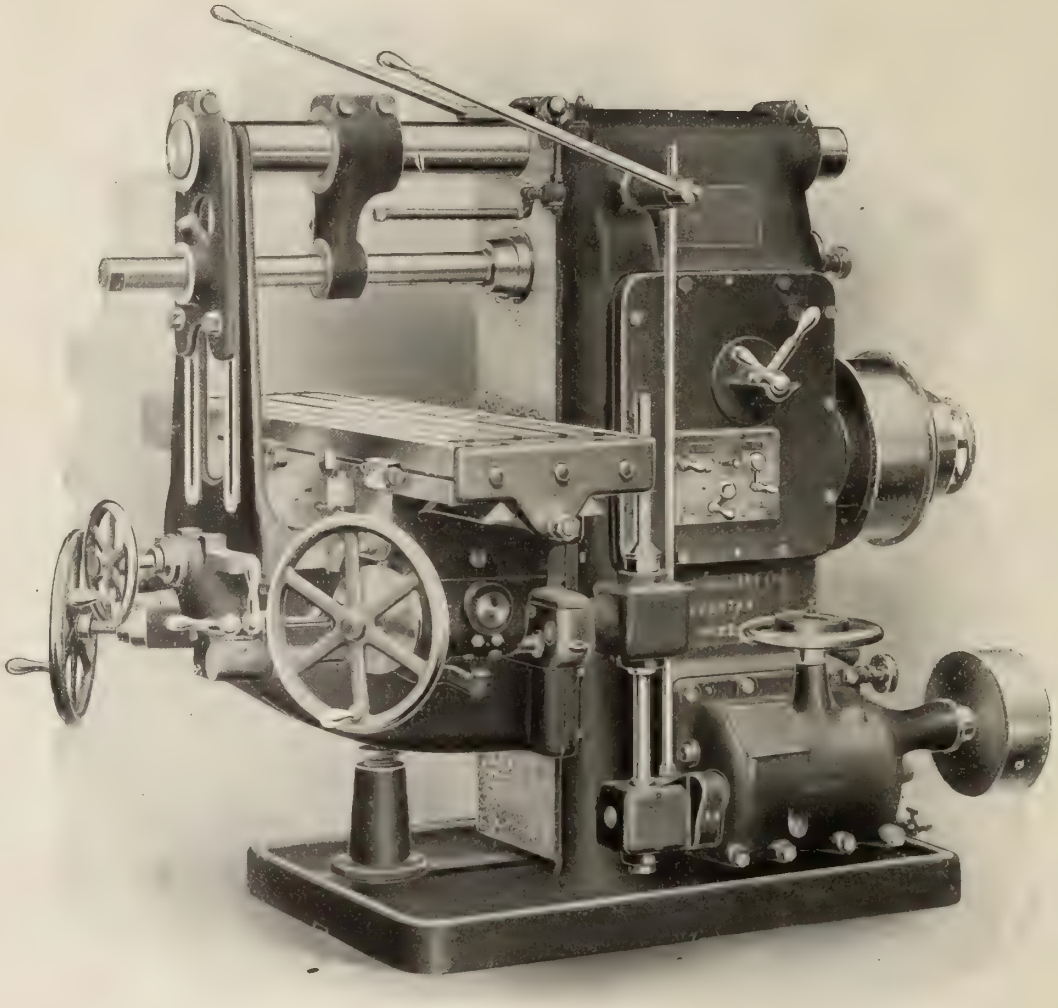
A WIDE RANGE OF WORK

can be successfully handled on the

ALFRED HERBERT LIMITED
HORIZONTAL MILLING MACHINES



No. 22 HORIZONTAL MILL, 42" x 13½" x 21".

WORKING SURFACE OF TABLE, 68" x 17", **AUTOMATIC FEEDS IN EVERY DIRECTION.**

These machines not only handle a **wide range of work,** but what is even more important, they **continue to handle it successfully,** or in other words, our Milling Machines will run with consistency and at the same time retain their accuracy.

All the materials used in their construction are severely tested in Herbert's laboratory.
